The chief crops are English walnuts, lemons, oranges, olives, apricots, figs, lima beans, and grain. This is a section where irrigation has not been been considered necessary for successful farming, although there is a growing belief that an increase in production in some crops, such as English walnuts and deciduous fruits, can be secured by irrigation that will more than justify the cost of applying the water. No attempt has been made to grow lemons without irrigation and most of the oranges are irrigated, although but few oranges are grown. The mean annual precipitation at Santa Barbara for forty-three years is 17.32 inches. While the rainfall is not much greater than for other localities farther south and inland where irrigation is very necessary, it has a better distribution. This with a moist atmosphere and mild climate produces luxuriant vegetation. The success now being had with lemons is prompting the conversion of much of the grain and bean land into lemon orchards, although lima beans themselves have given good profit in late years. Lemons are irrigated four times in a season, oranges three times, and walnuts once in the few places where they have been irrigated at all. Strawberries and garden truck are irrigated where grown. Where walnuts have been irrigated the results have proven beyond doubt the value of irrigating them. The duty of water near Santa Barbara is a little higher than in the fruit districts farther south and inland, and 1 miner's inch serves 10 acres of citrus fruit while walnuts and deciduous fruits require less water.

The numerous streams draining the southern slope of the Santa Ynez Range are short with small drainage basins and rapid fall. They are torrential following rains and the discharge becomes very low in the summer. The total watershed contributing to the coastal plain is about 100 square miles. The hills and mountains are covered with a thick mat of brush with a little timber on the higher peaks. Few of the streams have well-defined channels across the valley owing to the water all being absorbed by the sands except for short periods in the rainy season.

The following streams drain to Goleta Valley: Tecolote, Winchester, Elwood, Glen Anne, Bartlett, and San Pedro, Las Vegas and San José creeks, Maria Ygnacio Canyon, San Antonio Creek, Arroyo Burro, and Alascadero Creek. Of the foregoing Maria Ygnacio is the most important stream. The streams leading to Santa Barbara are: San Roque, Diablo, Mission, Rattlesnake, and Sycamore canyons. Those draining to Montecito are: Cold Spring, Dinsmore, and Romero canyons and Ficay Creek. The streams discharging into Carpinteria Valley are: Toro Canyon, Arroyo Parida, Santa Monica, Franklin, and Sutton canyons, Carpinteria and Gobernador creeks and Rincon Canyon.

All of the surface water of the streams is used for irrigation during the summer. Water is diverted through small ditches and pipe lines. An idea of the size of these streams may be gained by the measurements of Mission Creek, one of the larger streams. These show extremes of .02 and 2.80 cubic feet per second from 1888 to 1903, inclusive.[1] Mission Creek has been one of the sources of supply for the city of Santa Barbara. The city also secures water from a tunnel 5,080 feet long in Cold Spring Canyon. The tunnel is closed by a bulkhead in the winter until a head of over 100 feet is raised over the outlet. On being opened it delivers 1 cubic foot per second for three months in the dry season. The city recently completed its Mission Canyon tunnel, 19,560 feet in length, extending entirely through the Santa Ynez Range, with the north portal in position to receive water from Santa Ynez River and from one or more protected reservoirs on this stream. The discharge of Mission tunnel in 1910 varied from 2.42 to 5.18 cubic feet per second. Several small privately owned tunnels collect water from Sycamore and Franklin canyons and Arroyo Burro. Much of the water used in this section is secured from wells, some of which flow. The city supplements its domestic supply from Mission Creek and tunnels by pumping the De La Garra wells, seven in number, and with depths from 200 to 700 feet. Wells in Goleta Valley are usually from 80 to 100 feet in depth. Cienagas lie back of low hills in Goleta Valley, where the pumping lift in wells is not over 20 feet. Water can be pumped with gasoline engines for $.0075 per miner's inch per hour. Some wells near Montecito are from 1,000 and 1,400 feet in depth and others in the gravels along the stream are from 100 to 300 feet in depth. Wells at Carpinteria 200 feet deep produce salt water unfit for irrigation, indicating that the source is the sea, while wells only 50 feet deep in the same locality furnish fresh water. It is possible that wells could be drilled through the salt water to penetrate the same strata found in the mountains, in which case fresh water should be secured. There are artesian wells near Carpinteria about 140 feet deep. A large portion of the coastal plain can be supplied with water for irrigation by wells.

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 116.

The fall of the mountain streams on the south side of the Santa Ynez is so great that there are few opportunities for storage. Gobernador Creek is said to have a reservoir site, but it is doubtful if there is enough water for storage. As the grain lands are converted into walnut and citrus orchards water will be required to produce the best results. The construction of Mission tunnel by Santa Barbara leaves the city in a position to carry out a comprehensive plan for storing the flood waters of the Santa Ynez and conducting them through the range. The high cost of the tunnel has had a tendency to discourage, for the time being, further investment for storage works, but it seems certain that this opportunity for a water supply will eventually be taken advantage of. The flood waters of Santa Ynez River would, in addition to supplying the city, furnish water for the irrigation of considerable agricultural land. Water has such a high value at Santa Barbara that the city should be able to withstand an unusually high expense for storage. A miner's inch or the one-fiftieth of a cubic foot per second of water flowing continuously at Montecito sold for $4,000 and some of the water has a much higher value for irrigation and domestic use on suburban estates. The plan involves the construction of Gibraltar reservoir to be located on the Santa Ynez below the junction with Mono Creek. Another site that has received serious consideration is on Mono Creek, the chief tributary of the river. Several other reservoir sites are located on the main river and tributaries. For the complete and best utilization of the flood waters storage must be provided to hold over water from years of high flood for use in the dry years. The Gibraltar site is most likely to be first utilized, although the discharge of the river should justify the final construction of supplemental reservoirs at one or more of the other sites. A 100-foot dam at Gibraltar would store 6,480 acre-feet while a dam 155 feet high would give a capacity of 15,793 acre-feet.[1] A 100-foot dam at the Mono site would give a capacity of 8,763 acre-feet. Measurements of the Santa Ynez at the Gibraltar dam site from 1906 to 1910 show a mean annual discharge of 94,000 acre-feet. The watershed above this site is 207 square miles. The reservoirs, if constructed, would be primarily for Santa Barbara, but some water should be available for irrigation and practically the entire coastal plain should eventually be irrigated from reservoirs and wells.

VENTURA AND OJAI VALLEYS.

The Spanish name, San Buenaventura, is usually shortened to Ventura in speaking of the city, river, and valley to which the original name was applied. The headwaters of Ventura River are collected into Ojai Valley and adjoining territory. This upper basin is drained to the Pacific through a narrow valley seven miles in length known as Ventura Valley.

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 116.

VENTURA VALLEY.

Ventura Valley has 3,700 acres of agricultural land of which 1,180 acres are irrigated. The crops consist chiefly of citrus and deciduous fruits, walnuts, olives, figs, alfalfa, and grain. The city of Ventura is located between mountain and sea at the mouth of the river. The valley is widest adjacent to the city where the width is only one and one half miles. Conditions in general are quite similar to those near Santa Barbara, irrigation not being absolutely necessary to the growing of crops. The mean annual rainfall at Ventura for a period of twenty years is 16 inches. The principal diversions from Ventura River are those of the Ventura Power Company which operates two small canals.

OJAI VALLEY.

The name Ojai is derived from the Indian and means ''nest.'' It well describes this mountain valley. Live oak and ivy abound in the valley and on the surrounding hills. The valley is 12 miles back from the Pacific coast, and Nordhoff, centrally located in the basin, is 750 feet above sea level. The valley contains 11,300 acres of agricultural land, of which 850 acres, mostly above Nordhoff, is irrigated. Crops include citrus fruits, almonds, apricots, apples, grapes, alfalfa, and grain. The land is held in farms of generally less than 40 acres when in orchard but larger when in grain. Numerous pumping plants supply water for the irrigation of orchards and small tracts and the San Antonio Water Company takes water from San Antonio Creek, a tributary of Ventura River, for use in the upper part of the valley. All of the surface flow during the irrigating season is used but large quantities of flood waters run to the sea during the winter season. The Matilija reservoir site is located on the creek by that name which is one of the chief tributaries of the river. Water stored here could be conveyed to lands in Ventura Valley or the lower portion of Ojai Valley.

Ventura River has a watershed of 190 square miles. The run-off is estimated at .15 cubic feet per second per square mile giving a mean discharge of 28 cubic feet per second. The flow becomes very low in the fall and any large extension of irrigation depends on storage. Some increase is expected from additional pumping plants in Ojai Valley.

UPPER OJAI VALLEY.

Upper Ojai Valley is at an elevation of 1,500 feet on the divide between Ventura River and Santa Paula Creek. It has an area of 1,900 acres of rolling land. It is divided from Ojai Valley by hills. The greater portion is drained to San Antonio Creek and Ventura River. The Upper Ojai Valley is less developed than Ojai Valley and the conditions for agriculture are not quite so favorable as in the larger and lower basin. The winter temperatures are too low to permit citrus fruit culture and aside from a few apricots and apples grain is the only crop. There is little or no irrigation and the extent of the underground water supply is undetermined. Water is secured from wells for domestic purposes. The upper end of the valley is productive of oil. The watershed tributary to the Upper Ojai is 27 square miles in area. No reliable estimate can be formed as to the probable future development as no knowledge is at hand regarding available storage sites and it is more probable that the flood waters, if conserved, would be used along Santa Clara River.

SANTA CLARA RIVER VALLEY.

Santa Clara Valley of Ventura County should not be confused with the valley of the same name lying just south of San Francisco Bay. Santa Clara River is the largest and most important stream in Ventura County. It is formed by the junction of Laguna and San Francisquito canyons in the northwestern portion of Los Angeles County. The Santa Clara flows westerly from this junction and soon enters Ventura County and discharges into the Pacific between the cities of Oxnard and Ventura. The Santa Clara has no tributaries of consequence from the south, but three large streams, viz., Santa Paula, Sespe, and Piru creeks, from the north, drain a larger mountain territory than the main river itself. The valley is 40 miles long and gradually widens toward the west until the open coastal plain, being the delta of the river, is reached. The valley contains a total of 120,800 acres of land suitable for agricultural purposes and of this 31,020 acres are now irrigated.

All of the usual varieties of soils are found in Santa Clara Valley. In the coastal plain the soil is generally heavy while in Santa Clara Valley proper the heavy soil is confined to the low lands bordering the river. The higher lands are sandy and close to the foothills the material is very coarse and many boulders are found. Alkali is present in large quantities in the lands bordering the coast and is also found in the low lands along the river. The greater part of the irrigated land is in the central portion of the valley about the towns of Piru, Fillmore, Santa Paula, and Saticoy. The irrigated crops include oranges, lemons, English walnuts, deciduous fruits, grapes, alfalfa, beans, and garden truck, while sugar beets are grown usually without irrigation. Some grain is also produced but never irrigated. Lima beans constitute the largest crop, there being an annual production of about 63 million pounds, more than one half of the world's lima bean supply. Sugar beets also occupy a large acreage on the coastal plain, the product being taken to Oxnard for manufacture. Beets are grown on land strongly alkaline. They are usually planted early so that the tops shade the ground by the time hot weather begins, thus preventing excessive evaporation of moisture from the soil and the concentration of salts at the surface. In general beans are grown on land a little higher than the beet lands. Beets are not irrigated except in very dry years, when in some cases a little water has been supplied.

At the head of the delta of the Santa Clara is the town of Saticoy, the center of a section where deciduous fruits and English walnuts predominate. Apricots lead among the fruits, but a variety is grown. In the middle portion of the valley, about Santa Paula, Fillmore, and Piru, there are many orchards, but the crops are much diversified. This section is adapted to lemons and some valuable lemon orchards are in the vicinity of Santa Paula. On some of the low land suitable for the growing of citrus fruits located close to the foothills the removal of brush and boulders is costly, but it is being cleared very rapidly for the setting of lemon trees. In the extreme upper portion of the valley, in Los Angeles County, there is little or no irrigation, practically all of the land being used for grain and grazing.

All of the summer discharge of Santa Clara River is taken out for irrigation and about forty pumping plants take water from wells. Diversion from the river is made by ditches and pipe lines, no attempt being made, as a rule, to install permanent dams or headworks on account of the torrential character of the stream, but temporary dams are constructed at the beginning of each irrigation season with the expectation that they will not remain through the winter. A few pumping plants are located near Fillmore and Santa Paula and more on the north side of the river near Saticoy. Some of the wells in this section flow. The following companies supply water in Santa Clara Valley:

Companies supplying water in Santa Clara River Valley, 1909.

Name.	Source of supply.
De Valle Company	Santa Clara River.
Piru Water Company	Piru Creek.
South Side Improvement Company	Santa Clara River and wells.
Sespe Land and Water Company	Sespe Creek and well.
Fillmore Irrigation Company	Sespe Creek.
Interurban Land and Water Company	Santa Clara River.
Turner Ditch	Santa Clara River.
Santa Clara Water and Irrigation Company	Santa Clara River.
Vineyard Ditch Company	Santa Clara River.
Santa Paula Water Works	Santa Paula Creek.
Thermal Belt Water Company	Santa Paula Creek and Santa Clara River.
Cerurga Water Company	Well.
Saticoy Irrigation Company	Wells.
Saticoy Water Company	Flowing wells.
Montalvo Irrigation Company	Well.

The distributing systems for orchards are of concrete pipe laid underground and those for flooding consist of open, unlined ditches. The quantity of water used varies greatly. Citrus orchards are usually irrigated every four or five weeks from May until September, inclusive, 1 miner's inch being sufficient for from 5 to 10 acres. The quantity of water applied to orchards under pumping plants does not exceed 1 acre-foot per acre, but under the ditches the duty is from 1 to 2 acre-feet per acre. Deciduous fruits, including English walnuts, are irrigated with less regularity than citrus fruits and require less water. Alfalfa is irrigated once after each cutting except the last and is given 3 acre-feet or more per acre each year. Sugar beets are sometimes irrigated once before they are up and once afterwards, although their irrigation depends much on the character of the land.

The mean annual rainfall for the valley as shown by records at Oxnard and Santa Paula is about 16 inches. Winds blow inland from the coast daily throughout the summer tempering the heat of the valley. In the winter the direction of the movement of air is often reversed when winds sweep down through the valley, often with disagreeable effect but sometimes preventing much damage to citrus fruits by frost. The idea has prevailed in Ventura County, especially on the coastal plain, as it has in Santa Barbara County, that irrigation is not necessary and the success of the lima bean industry without irrigation has done much to divert attention from the development of the water resources of the county. Within the last few years more interest has been taken in irrigation through the belief that the lands now giving fair profit without water would yield a much larger one if irrigated. The principal development taking place at the present time consists in the installation of private pumping plants. The underground water of both delta and valley is very extensive and a very large portion of the land could be supplied from this source. Where flowing wells can be secured it is usually necessary to bore only about 200 feet in depth. Water can be secured in nearly any part of the valley at less than 50 feet and near the coast sometimes at less than 10 feet below the surface. Much of the land about Oxnard requires drainage for the highest development and comparatively small portions have already been tile drained.

As the lands near the coast become less moist it is probable that higher-priced crops will be grown on them and these in time will require irrigation. If the water be supplied by pumping from wells, with a corresponding general lowering of the water plane, the lower lands will be further dried and gradually the entire section may become irrigated, as has been the case in a number of other similarly located sections in the southern part of the State.

The utilization of all the underground water of the valley, together with the conservation of the flood waters of the main stream or its tributaries, would furnish all the water necessary for the irrigation of every acre of valley land. A reservoir site on Sespe Creek near its mouth has been examined by engineers and pronounced feasible for the storage of flood waters. It is probable that other reservoir sites exist in such a large area of mountainous country. The drainage basin of the Santa Clara is 1,576 square miles in area, the larger portion of which is from 4,000 to 7,000 feet above sea level. The three main tributaries are very torrential. Much water sinks on reaching the valley and underground water is so abundant that pumping has had little effect on the level.

Measurements of Santa Clara River at a point above Santa Paula made in June, July, August, and September, 1903, indicate that the summer flow of the river varied from 30 to 45 cubic feet per second. The river was discharging 127 cubic feet per second when measured in May of the same year.[1] The run-off of the Santa Clara is estimated at not less than 200,000 acre-feet, which is sufficient for all of the unirrigated valley land.

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 134.

SIMI AND LAS POSAS VALLEYS.

Simi, Little Simi, and Las Posas valleys are situated south of Santa Clara Valley along a stream which is dry the greater part of the year and which is known as Arroyo Simi in its upper course and Arroyo Las Posas in the lower. The Arroyo joins Calleguas Creek, which empties into the Pacific at Mugu Laguna. Simi Valley, which is the upper one of the three basins, is separated from San Fernando Valley in Los Angeles County by the Santa Susana pass. The basin contains 13,900 acres of cultivable land, of which 530 acres are now irrigated. The Little Simi is west of and below Simi Valley. It contains 13,500 acres of valley land of which 600 acres are irrigated. Las Posas Valley, the lower one of the three basins, opens to the coastal plain about the city of Oxnard. It contains 32,300 acres of agricultural land. Connejo Valley is situated in the hills south of the Little Simi at an elevation of about 1,000 feet and has an area of 15,000 acres devoted entirely to grazing and stock raising.

Conditions in the three main valleys on the arroyo are very similar. The farms vary from 40 acres to several hundred acres, the larger ones being parts of ranches of several thousand acres extending into the hills and mountains. Crops grown include grain, beets, deciduous fruits, alfalfa, and some grapes in the Little Simi. The principal crop in Las Posas Valley is lima beans although there is a little deciduous orchard. Underground water conditions are fairly good in Simi Valley and wells bored to a depth of 80 feet in the lower portion flow. Where the flow is light pumps are used to increase the discharge. The underground water is apparently not so extensive in the Little Simi and wells must be pumped. Ground water is found at depths of 60 to 100 feet in Las Posas Valley, most of the wells being for domestic use.

An irrigation system has been planned for Little Simi Valley to be operated by a mutual company of land owners, the water to be secured from wells in the upper part of the basin. In a well 90 feet deep in this locality water stands at 10 feet beneath the surface. The water is to be used on about 300 acres located principally below Moorpark. The hills surrounding the valleys are low and some of them are denuded of brush and are used for grazing. The arroyo and its tributaries discharge no water on the surface except for short periods following storms and development of valleys by irrigation depends almost entirely on underground water. It is possible that the western portion of Las Posas Valley, sometimes called Pleasant Valley, might be supplied with water from Santa Clara River brought around the point of the hills at Springville, provided all of the water is not needed on the Santa Clara. The irrigated area should be doubled by pumping.

Summary for Santa Barbara and Ventura counties.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
Santa Maria and Cuyama valleys	192,000	11,441	140,000	Storage on Santa Maria and Sisquoc rivers and underground waters.
San Antonio and Los Alamos valleys	15,800	1,750	5,000	Underground waters.
Santa Ynez and Lompoc valleys	58,300	1,675	25,000	Storage on Santa Ynez River and tributaries and underground waters.
Santa Barbara coastal plain	30,750	600	25,000	Storage on Santa Ynez River and tributaries and underground waters.
Ventura and Ojai valleys	16,900	2,040	5,500	Storage on Matilija Creek and underground waters.
Santa Clara River Valley	120,800	31,020	120,000	Storage on tributaries of Santa Clara River and underground waters.
Simi and Las Posas valleys	74,700	1,130	2,000	Underground waters.
Totals	509.250	49,656	322,500	

LOS ANGELES AND SAN GABRIEL RIVER LANDS.

These lands are considered together, not so much because the streams supply the same underground water basin underlying the coastal plain as on account of other conditions which they have in common. This division, together with the territory of Santa Ana River, constitutes the principal belt of southern California's coastal drainage. but its continued development depends upon some events that do not affect lands on the Santa Ana. All parts of this division, San Fernando Valley, San Gabriel Valley, and coastal plain, may receive water from another watershed. The Los Angeles aqueduct, costing $23,000,000, will deliver water by 1913 from Owens River, 270 miles distant, for irrigation at the rate of 360 cubic feet per second, or enough to irrigate over 100,000 acres of orchard, for use on land adjoining the city limits.

Water rights on Los Angeles River have been on a somewhat different basis from those on other streams, due to the city's pueblo right, strengthened by the superiority of domestic over agricultural and mechanical uses.

Land values throughout this division are influenced by the growth of Los Angeles and its suburbs, and the excellent county roads and network of electrical railroad lines extending from the city in all directions. In some areas, as for example near Pasadena, land that meets all the ordinary requirements for agricultural use has not been given such classification, because present indications are that it will be used for suburban residence instead of for agricultural purposes.

Flood waters have not been stored in the mountains, but preparations are being made for impounding the headwaters of Los Angeles River and similar improvements are expected in time on the San Gabriel.

SAN FERNANDO VALLEY.

San Fernando Valley is a basin 101,150 acres in extent, lying north and west of the city of Los Angeles. A narrow strip of land back of Verdugo hills and connected to the main valley at Verdugo and Tejunga canyons adds 9,350 acres to the agricultural area. The San Rafael hills divide the basin from San Gabriel Valley on the southeast. There is comparatively little drainage to San Fernando Valley from the south, west, and northwest. Numerous small creeks rise in the mountains and hills but they are dry throughout most of the year and their channels disappear altogether on reaching the valley. Brown's Canyon is the largest of these streams. The western extension of the San Gabriel Range is drained by Tejunga River, the Little Tejunga, and Pacoima Creek into the valley from the northeast. An extensive débris fan spreads across San Fernando Valley below Big and Little Tejunga canyons. All waters at ordinary states of the river disappear on reaching the valley. The waters entering San Fernando Valley from all sides and disappearing in the sands and gravels are brought to the surface in the lower and southern part of the valley, giving rise to Los Angeles River. This stream finds an outlet toward the Pacific through the narrows just above the city where the entire drainage of the valley is forced to pass either on the surface or as subterranean flow, making a very favorable condition for the recovery of underground water.

The floor of San Fernando Valley is a broad plain of gentle slope with some rolling land on the borders. The land in its natural state is covered with a sparse growth of cactus, sage, and chaparral, with some willow along Los Angeles River. The soil varies in hardness but the greater portion of the valley is sandy or gravelly loam. Some adobe is found near the southern hills while a sandy silt soil borders the lower course of Los Angeles River. About 10,000 acres of Tejunga and Pacoima washes lined with gravel and cobble must be considered uncultivable unless it is demonstrated that it is adapted to fruits or other crops high enough in value to justify clearing. The general slope of the land in the western portion of the valley is from 40 to 50 feet per mile but in the eastern portion the slopes reach 200 feet per mile near the hills. A large portion of the land in the southwestern part of the valley is contained within the Lankershim and Van Nuys ranch. This property is being sold to settlers in tracts of from 5 to 20 acres. Grain ranches along the bordering hills vary from 80 to 300 acres in size. A 1,500-acre olive grove, the largest in the world, is located near San Fernando. The McClay Rancho Water Company and the Mission Land and Water Company control a large acreage near San Fernando in this section of the valley while individual holdings are from 10 to 40 acres. The Tejunga Water & Power Company has subdivided a large tract of land below Tejunga Canyon and some small tracts have been purchased by settlers. Near Burbank the land holdings range from 20 to 80 acres while on the extreme lower portion of the river about Glendale the holdings are smaller and seldom exceed 40 acres. Many vegetable gardens of 5 to 10 acres are within the city limits.

The southwestern portion of the San Fernando Valley, comprising fully one half of the entire area, has been used for grain growing and grazing for many years. In 1912, 11,000 acres of sugar beets were grown by the American Sugar Beet Company without irrigation in this district. Some alfalfa is irrigated near Chatsworth and throughout the northern portion of the valley citrus fruit, olives, alfalfa, and grapes are irrigated; also some garden truck in the Tejunga area. The citrus orchards near Burbank and Glendale are all irrigated; also some of the walnut orchards. Some alfalfa near Burbank is irrigated. A great variety of garden vegetables are irrigated along the river just above the city of Los Angeles. Citrus and deciduous fruits, olives, and grapes are irrigated at La Canada and La Crescenta. Some deciduous fruits are grown in the eastern portion of the main valley but they are not generally irrigated.

A total of 10,010 acres in the main valley, and 800 acres in La Canada Pass is irrigated. Most of the irrigation in the main valley is near Fernando and Burbank. The Chavez-Feliz ditch covers 300 acres of the vegetable district on the west side of Los Angeles River in the city. Land near La Canada, La Crescenta, Glendale, Fernando, and Roscoe are furnished water by small companies. Pumping plants are scattered throughout the northern and eastern portions of the valley and in many cases they are used to supplement water from company systems when the supply is low. The land near Burbank is irrigated exclusively from private pumping plants.

The city of Los Angeles, in planning for the disposal of water brought from Owens River by the aqueduct, places the duty of water for San Fernando Valley at seven and one half acres per miner's inch flowing continuously, or 5 acres per miner's inch for a season of 250 days, which is equivalent to 2 acre-feet per acre. Near San Fernando the companies now operating estimate that 1 miner's inch is sufficient for from 7 to 8 acres and orchards are giving good results with the use of 1.1 to 1.5 acre-feet per acre annually. Tejunga Water and Power Company allows 1 miner's inch for 5 acres at a rate of 1 cent per 24-hour inch. A miner's inch under the Verdugo Canyon system serves 7 acres. The Monte Vista Water Company delivers 60 miner's inches for twenty-four hours to 20 acres every twenty-three days, making the amount applied .9 acre-feet for a season of six months. The average amount of water used in the vegetable gardens is from 3.5 to 4 acre-feet per acre per year. Some of the walnut orchards near Burbank receive from .5 to .8 acre-feet per acre while others are not irrigated. In this locality alfalfa produces seven crops per season, there being an irrigation for each. The duty of water for alfalfa, based on the discharge of pumping plants claimed by farmers, is from 2.5 to 2.8 acre-feet per acre. Alfalfa is irrigated by being flooded between field borders and by the use of detachable surface pipe. Water is usually distributed in the truck gardens by board flumes. For citrus orchards concrete underground pipe systems are used. The conditions for drainage in the San Fernando Valley are good. The sandy character of the soil and the rapid fall in the land are conducive to natural drainage.

The Spanish Pueblo of Los Angeles was granted all of the waters of Los Angeles River. The Supreme Court of California in upholding this right has ruled that all the waters of the river and its tributaries both above and below the ground surface may be used by the city if needed. As this includes the entire drainage basin of San Fernando Valley development of water by private corporations has been somewhat discouraged. The city's pueblo right is strengthened by domestic use being superior to agricultural use. In late years the city has enjoined a number of individuals from operating pumping plants in the valley but it is understood that the right is to be enforced only in case of shortage, which contingency is not likely to arise in the future as the aqueduct will supply more water from Owens River than is needed for domestic use. The rights of the Chavez-Feliz ditch are defined by the court decisions and some water is allowed for use under this ditch. Water from Brown's Canyon is claimed by the San Fernando Water Company. Water from San Fernando Creek is used by the Mission Land and Water Company while that from Pacoima and Little Tejunga creeks is diverted by the McClay Rancho Water Company. Rights on Tejunga River seem well adjusted between the company and the private appropriators. Litigation over the water from Verdugo Canyon has now been settled. The Tejunga Water and Power Company has filed on all of the unused waters of Tejunga River to be used for both power and irrigation and this company controls ten mountain reservoir sites on the river which it is proposed to develop in the future. It is probable that construction of one or more of these will be begun as soon as water from Owens River becomes available for use in Los Angeles and the surrounding country. The use of the water for power will not be adverse to irrigation as it can afterwards be delivered for use on lands below Tejunga Canyon and too high to be covered from the aqueduct reservoirs.

It is probable that reservoir sites might be found on Little Tejunga and Pacoima creeks suitable for storage of the flood waters. The San Fernando Water Company holds a reservoir in Brown's Canyon with an estimated capacity of 2,500 acre-feet but the watershed of this stream is so poor that the reservoir has not been of great value. Two reservoirs, with a combined capacity of 40,000 acre-feet, are to be constructed in connection with the Los Angeles aqueduct northwest of Fernando and another is projected for a site southwest of Chatsworth with capacity of 45,000 acre-feet. A reservoir at this point would be in a position to serve 23,700 acres in the southwestern portion of the valley.[1]

---

[1] Report of Advisory Engineers on distribution of surplus water from Los Angeles aqueduct.

The chief source of water for the further development of San Fernando Valley will be the Los Angeles aqueduct. The city was taking about 60 cubic feet per second by pumps from the river in 1911 and it was estimated that about double this amount will be required for domestic use within a few years. Allowing for this increased use there remains 360 cubic feet per second of water to be brought by the aqueduct by 1913 for use in irrigating lands adjacent to the city. The plans being formulated for the disposal of this water will confine its use to districts now adjacent to the city which can be conveniently annexed if the population spreads until it covers these lands. If the water is used for irrigation at the rate of 1 miner's inch per seven and one half acres and at some future time the water is required for domestic instead of agricultural uses on these lands there will be more than a sufficient amount for domestic use. The surplus water from the aqueduct will be more than is needed for the irrigation of all of the land of San Fernando Valley. It is proposed to give the land owners of this valley preference in subscribing for the use of water from the aqueduct because its application in San Fernando Valley will be advantageous to the city in several respects. It would no doubt require less distributing pipe than for the conveyance of water to districts south and east of the city. The chief advantage, however, is the favorable condition for the recovery of water that returns to Los Angeles River from the soil. It is estimated that one fourth of the amount applied to land in San Fernando Valley will reach the narrows above the city as surface or underground water. It is the plan of the city to construct and retain ownership of the main distributing pipes from the aqueduct and to charge an annual rental to associations of water users taking the water. The price proposed is reasonable compared with prices for water for citrus orchards south of the Sierra Madre Range. The terminus of the aqueduct north of San Fernando is at an elevation of 1,400 feet above sea level. From this point the water will drop 300 feet to the San Fernando reservoirs, the resulting head being used for the development of power. The reservoirs have an elevation that will command 95,000 acres by gravity in the valley. The extreme northern portion of the valley above these reservoirs can be fully irrigated from Tejunga River, Pacoima Creek, and other local sources.

If the restriction imposed by the city on the pumping of underground waters in San Fernando Valley is withdrawn it is expected that development will proceed rapidly. The underground water conditions already favorable will be improved by seepage from land supplied with aqueduct water.

Water can be pumped for $.005 to $.015 per miner's inch per hour throughout the greater portion of the valley. In general the depth to ground water becomes less from the north and west to the southwest. Water stands at 80 feet below the surface in a well 300 feet deep on the olive grove above San Fernando. Wells north and east of San Fernando from 80 to 100 feet in depth require the water to be lifted about 60 feet. Water stands at from 50 to 80 feet in wells drilled from 250 to 300 feet in the vicinity of Van Nuys. Near Burbank the depth to water is usually not over 30 feet and wells are bored from 60 to 100 feet deep. The pumping lift on the Orange Cove tract is 212 feet. It is not expected that the irrigated area near Glendale will increase as this is fast becoming a suburban residence district to the city. Eagle Rock Valley near Glendale formerly contained some irrigated land but this is now being transformed into a suburb. Water must be lifted about 160 feet near La Canada. It is probable that this section will also become a residential district. Near Sunland south of Tejunga River water must be lifted from 60 to 80 feet in wells.

The entire watershed tributary to the San Fernando basin is 310 square miles in area. The most valuable part of the watershed as a water producer is that drained by Tejunga River, Little Tejunga and Pacoima creeks with an area of 190 square miles. The run-off from this area should be sufficient with storage to supply all of the lands in San Fernando Valley that cannot be economically reached by laterals from the aqueduct or from wells.

SAN GABRIEL VALLEY.

San Gabriel Valley, like San Fernando Valley, is almost completely surrounded by hills and mountains. Its only drainage exit is Paso de Bartolo, two miles wide. Besides San Gabriel River, small streams that enter the valley from San Gabriel Mountains, to be lost in the sands but which may be considered tributaries of the main stream, are: San Dimas Creek, Big Dalton, Little Dalton, Sawpit, Santa Anita, Little Santa Anita, Eaton, Los Flores, and Rubio canyons. Arroyo Seco enters the northeastern corner of the basin above Pasadena, but finds an outlet to Los Angeles River through the hills on the west. Millard Canyon joins the arroyo. San Gabriel Valley consists of the débris fans or cones of the river and tributaries. The alluvium has been raised until it is certain, as shown by borings, that the depth to bedrock at places exceeds 1,000 feet. It is evident that there is some barrier to the passage of underground water southward from Pasadena and that this barrier, now buried by the alluvium, is an extension of Raymond Hill and Oak Knoll toward the northeast, although the surface contour shows but little evidence of such extension. A similar condition is found at the eastern extremity of the valley near the head of San Dimas wash where hills intercept the underground waters. The head of this wash is very favorable for securing good wells, although the summer discharge of San Dimas Canyon is very small. The débris cones of the streams are very coarse and porous near the canyons and readily absorb large quantities of water. Boulders, cobbles, and gravel are found in great abundance along the washes. The material becomes gradually finer and grades to sand and silt in the lower courses of the channels. The water of all tributaries of San Gabriel if not taken out for irrigation would be entirely absorbed before reaching the river except during floods. The river itself has considerable discharge throughout the year, although all of the water is diverted in the canyon for irrigation during the summer. The lower part of San Gabriel Valley has an abundance of underground water due to all water absorbed above having to go through Bartolo Pass.

Portions of San Gabriel Valley are highly developed, due to their natural surroundings and to their proximity to Los Angeles. The portion of the valley east of the river includes the famous citrus districts of Covina, Azusa, Glendora, and San Dimas. The higher lands in the western section about Pasadena, South Pasadena, Alhambra, San Gabriel, Altadena, Sierra Madra, Monrovia, and Duarte, are as well adapted to citrus culture as the eastern portion of the valley, but, excepting Duarte, are not so advantageously situated for water from streams. The upper portion of the San Gabriel basin has gravelly and sandy loam soils and good drainage, the slopes being from 100 to 200 feet per mile. The lower portion of the valley slopes at the rate of about 50 feet per mile and has soils finer in texture. These low areas are frequently visited with frosts and are not adapted to citrus culture. A variety of crops are raised, including alfalfa, deciduous fruits, English walnuts, strawberries, and garden truck, all of which are irrigated, and barley for hay and grain grown without irrigation. A large part of the Baldwin ranch, including the La Puente grant, is devoted to grain growing. This property borders San Gabriel River and has an area of 3,300 acres. Aside from this ranch holdings are generally small, the usual size of an orange orchard being about 10 acres. Walnut orchards are from 10 to 40 acres.

The San Gabriel Valley has a total of 78,636 acres of agricultural land, of which 36,536 acres are irrigated. Water for the foothill districts on the west side of the river is secured from pipe lines and tunnels in the small mountain canyons and from pumping plants. Several water companies furnish domestic water to Pasadena and surrounding settlements, the service including the irrigation of small tracts of fruit, garden, lawns, and shrubbery. Two submerged dams have been constructed in the channel of Arroyo Seco, which have been effective in raising the water level behind them and thereby reducing the head against which pumping plants must work. The Azusa and the Covina irrigating companies supply about 1,000 acres of citrus orchards near Azusa, Covina, and Glendora on the east side of the river, the water being diverted from San Gabriel Canyon by a dam and tunnel and conveyed to the orchard by cement-lined ditches and underground cement pipe. The Duarte Mutual Company diverts water on the west side of the river for citrus orchards. A small amount of gravity water is secured from San Dimas Canyon by the San Dimas Irrigation Company, but the main supply of this company is from pumping plants in the head of the wash near San Dimas. Water is pumped in the wash below San Dimas Canyon and conveyed to lands near Glendora, Azusa, and Covina. There are in all over 40 water companies. Nearly all of these supply water for agricultural purposes alone and are mutual organizations of the land owners. The systems of the private companies that formerly furnished domestic water to Pasadena were purchased by the city in 1912. There are no flowing wells, but pumping plants are found throughout most of the valley. Some of the most productive wells to be found are those in the vicinity of Irwindale, pumped to supplement the gravity supply of the Azusa and Covina Irrigating Company. Single wells in this locality are claimed to deliver upwards of 300 miner's inches. The gravels which they penetrate are supplied by water percolating southward from San Gabriel wash. These gravels are so coarse that they not only give up the water with which they are saturated very readily, but are soon recharged by the flood waters from San Gabriel Canyon. The Irwindale wells are bored to depths of 400 to 500 feet and the water must be lifted from 60 to 100 feet. The depths of wells in San Dimas wash is about the same, but the lift is higher and varies from 150 to 225 feet. There is an abundance of underground water south of El Monte and just above Bartolo Pass, the plane being from 5 to 10 feet below the ground surface. North of El Monte the depth to well water increases to about 90 feet. In the vicinity of San Gabriel and Alhambra the water level stands at from 50 to 100 feet below the surface.

The following companies operate in San Gabriel Valley, nearly all of which are mutual organizations:

San Dimas Irrigation Company.
Artesian Belt Water Company.
Le Verne Irrigating Company.
Frostless Belt Water Company.
New Deal Land and Water Company.
Glendora Mutual Water Company.
Glendora Irrigating Company.
Azusa Irrigating Company.
Azusa Agricultural Water Company.
Citrus Belt Water Company.
Covina Irrigating Company.
Columbia Land and Water Company.
La Puente Coöperative Water Company.
Duarte Mutual Irrigation and Canal Company.
Beardslee Water Ditch Company.
Monrovia Water Company.
Monrovia Acres Water Company.
Walnut Grove Mutual Water Company.
Sierra Madre Water Company.
Baldwin Park Water Company.
West Coast Water Company.
Lincoln Avenue Water Company.
Euclid Avenue Water Company.
Rubio Canyon Land and Water Association.
Los Flores Water Company.
Precipice Canyon Water Company.
Craig Lambert Water Company.

Garvey Water Company.
Fairlee Water Company.
Pasadena Land and Water Company.
Pasadena Lake Vineyard Water Company.

The duty of water for citrus orchards throughout this belt may be stated as about 10 inches in depth annually on the land or as from 7 to 8 acres per miner's inch flowing continuously. In the lower part of the valley walnut trees are sometimes set with an unusually wide spacing and alfalfa grown between the rows. For this land it is usual to apply from 2 to 3 acre-feet of water per acre annually. Walnuts alone require less water than citrus fruits. Agricultural practice is as good as can be found in any irrigated district in the West, the culture being very intense, especially in the orchards. Every precaution is taken to conserve the moisture applied. Several areas of moist land on the Potrero Grande grant have been tile-drained with good results. The water previously stood within 5 feet of the surface. As more wells are drilled to supply the unirrigated lands of the Baldwin ranch it is probable that the ground water will be sufficiently reduced to dry some of the land that is now moist along the southern boundary of the basin. Alkali is not present in these localities to any great extent.

The rights of most of the companies diverting water from the streams have been fixed by court decrees. The San Gabriel Power Company utilizes a portion of the waters in San Gabriel Canyon for the development of electric power. The company has constructed a submerged dam across the canyon, which is one of the most effective dams of this type and which enables practically all of the normal flow, both surface and underground, to be conducted through the power house. The conveyance of the water in pipes for power results in a saving. The salvage has been determined and has been purchased by the Covina Irrigating Company, by which it is used.

Considerable of the land now being dry-farmed in San Gabriel Valley can be irrigated with underground water, but it is not probable that this supply will be sufficient for all of the dry land and it is doubtful if there will be any material increase from a more economical use of water. The Los Angeles aqueduct engineers report that water could be conveyed from the aqueduct at a point north of San Fernando, through La Canada Pass to lands at Pasadena, South Pasadena, and Alhambra, and estimate that the city can afford to furnish water for the irrigation of 13,920 acres after first providing for San Fernando and Cahuenga valleys. It would also be possible to extend the service of the aqueduct to an area of 38,250 acres west of the river and 40,000 acres east of the river in San Gabriel Valley, provided the water is not asked for by the land owners of San Fernando or Cahuenga valleys. Water, if received from the aqueduct, will be at the rate of 1 miner's inch for seven and one half acres. The discharge of the stream is so erratic from season to season that storage reservoirs, to be serviceable, should have sufficient capacity to hold back enough water from years of copious rainfall for use in dry years. A high cost for storage should be justified by the value of the water for citrus orchards. One of the most serious problems in the maintenance of reservoirs on such streams as the San Gabriel is to prevent the rapid filling up of the basin by the débris carried by the streams. Reservoirs in some of the main canyons would have to pay for themselves in a comparatively short period of years, as their capacity and usefulness would be reduced. So long as dams are not constructed for the storage of flood waters much could be accomplished in replenishing the underground waters of San Gabriel Valley by the spreading of the flood waters over the gravels below San Gabriel Canyon. This kind of storage has been effective on other streams in southern California where the conditions are no more favorable than those on the San Gabriel.

The San Gabriel has a mountain watershed of 222 square miles, over which the annual precipitation varies from 15 to 40 inches. The winter snows are held on the higher peaks well into the summer. The gagings[1] of the river above Azusa since 1896 show a maximum discharge of 11,000 cubic feet per second occurring in March, 1905. The minimum discharge is 3 cubic feet per second in July; also September of 1899, and September, 1900. The greatest total annual discharge is 351,000 acre-feet, the amount for 1906-7, and the lowest 10,000 acre-feet, the amount for 1898-99. The mean annual discharge is 104,500 acre-feet. Without storage the entire discharge of San Gabriel River and of the other small streams entering the valley is not sufficient in the driest years for the irrigation of all of the agricultural land, but with storage capacity sufficient to take care of all of the flood waters in ordinary years and with further development of underground waters it is possible that all of the land can be irrigated.

SAN JOSE CREEK VALLEY.

The territory included under this heading is the valley of San José Creek, reaching from Puente to a point about 2 miles below Spadra. The valley is from 1 to 3 miles in width only and lies between Puente and San José hills, the latter range separating it from Covina Valley on the north. San José Valley contains a total of 10,350 acres, of which 3,401 acres were irrigated in 1909. The greater portion of the land lies within Rancho La Puente, but the lower valley lands which are irrigated have been cut up into holdings of from 5 to 40 acres. The higher lands bordering the hills on both sides of the valley are used for grain and hay and are dry farmed in larger tracts. Several small ditches take all of the surface flow of San José Creek during the irrigating season. In recent years many pumping plants have been installed in the bottom lands close to the creek. Oranges, lemons, deciduous fruits, strawberries, and alfalfa are the principal crops irrigated, while many of the English walnuts also receive water. Alfalfa and deciduous fruits are not grown in large quantities, but the valley has developed very rapidly during the past few years by the increase in citrus and walnut orchards and berry patches.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

The ditches along San José Creek have rights based on the riparian land irrigated and on appropriation and use. One case of litigation hinged principally on whether underground water was the subterranean flow of the creek or percolating water saturating the valley. In the recent suit entitled *Hudson* vs. *Daily,* the court enjoined the defendant from driving a tunnel where it would draw water already appropriated directly from the creek itself.

San José Creek has no mountain watershed and the local drainage from San José and Puente hills is of little consequence. A few flood water channels reach back into the hills for 3 or 4 miles, but there is scarcely any surface flow in any of these when water is needed for irrigation. Further development by the extension of the irrigated area must come entirely from sinking more wells or from a more economical use of water. At the present time a goodly number of wells are being drilled in the lower part of the valley, from Walnut to Puente, and it is difficult to estimate the ultimate acreage that can be irrigated without an overdraft on the underground supply. There has been some reduction in the underground level during the past few years, but as yet the pumping lifts are not comparatively high. It is probable that at least two thirds of the agricultural land will eventually be brought under irrigation. Owing to the proximity of the hills inclosing San José Valley the precipitation is greater than in the more open and larger valleys on both the east and west. The section about Walnut, in spite of its comparatively low elevation with reference to Pomona, Covina, and other neighboring fruit districts, is favorable for the growing of oranges, and damage which would otherwise result from frosts in this lower area is prevented by the unusual air movement through the narrow valley. Berry growing and truck gardening will no doubt continue to be one of the principal industries.

LOS ANGELES COASTAL PLAIN.

The coastal plain south of Los Angeles and east of Orange County is 242,500 acres in area and is one of the largest bodies of agricultural land in southern California. The plain is limited on the north by Santa Monica Mountains and Puente hills. On the west is the Pacific Ocean and on the south San Pedro Bay. The part from Hollywood to Santa Monica is known as Cahuenga Valley. The plain has a gentle slope from elevations of 200 to 300 feet along its northern boundary to sea level. The land probably originated in part from the alluvial deposits of Los Angeles and San Gabriel rivers and in part by the wash of the sea. There is no exact demarcation between the lands of these two rivers and those of Santa Ana River, farther to the east. A conspicuous break in the slope of the plain itself is a ridge or line of knobs running southeast from Cahuenga Valley to Alamitos Bay at the mouth of San Gabriel River on the southern coast, the highest point of which is Los

Cerritos, just back of Long Beach. This ridge is an important factor in the action of underground water by holding a high level on the upper side.

The soils throughout this area are generally fine in texture. A large area on Ballona Creek has dark brown loamy soil. Some clay is found in the vicinity of Inglewood, but the most of the soil is sandy and silt loam, the latter occurring along the river channels. The bench lands near Whittier consist of an open surface soil with good drainage underlaid with a more compact subsoil. Some adobe occurs in the lowest portions of the plain and limited areas of peat border Alamitos Bay, Wilmington Lagoon, and several sloughs. Lands containing from 1 to over 3 per cent of alkali are near Wilmington Lagoon, northeast of Inglewood, south of Gardena, near Nigger Slough, north of Dominguez hills at the mouth of Ballona Creek, and in a few other isolated spots.[1] Some of the land along Los Angeles and San Gabriel rivers has from .6 to .4 per cent, while throughout the remainder the alkali content is less than .4 per cent. Much of the low land between the two rivers is moist and has been used principally for pasture. Sugar beets are grown on portions where there is too much salt for other crops.

In the vicinity of Whittier the land has a slope of about 50 feet per mile, but the lower portions of the plain are very flat. This entire area was originally in Spanish grants, which, after passing into the hands of American owners, were first operated as large ranches, but in later years some have been colonized. As a result of this the land holdings are either very large or very small. Near Inglewood and Gardena tracts are usually from one half to 5 acres. Throughout the coastal plain the subdivided land holdings seldom exceed 40 acres and the majority are from 5 to 10 acres.

Citrus and deciduous fruits, garden truck, strawberries, and alfalfa are always irrigated as are most of the walnuts. The irrigation of sugar beets usually consists of a single irrigation of the land before the seed is planted. Beans irrigated in 1911 under the Rodeo Land and Water Company system gave an increased yield of about one third. Citrus fruits are confined nearly altogether to the bench lands bordering Puente hills, near Whittier. Just below these lands is a strip of country reaching as far south as Downey, devoted largely to the culture of the English walnut. Throughout the rest of the plain the crops are diversified, barley, corn, melons, and beans being grown without irrigation in addition to the irrigated crops previously mentioned. Lima beans occupy a large area in Cahuenga Valley and English walnuts and alfalfa are grown along Ballona Creek. Some citrus orchards are located near Hollywood. The territory immediately adjoining the Los Angeles city limits on the east and south and including the settlements of Newmark, Gardena, Moneta, and Inglewood, is devoted largely to garden truck and berries, while sugar beets are best adapted to the low-lying lands near the southern coast. Alfalfa is grown throughout the central portion of the plain and about Artesia and Norwalk. Some orange groves are found in the Whittier hills. Whittier is one of the important walnut sections in the State and has an association with 180 members representing about 3,000 acres in groves. The value of the walnut crop of this district is estimated at about one million dollars annually. Some walnut orchards are, however, being replaced with Valencia oranges.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Los Angeles Area, Cal.

A total of 117,507 acres is irrigated on the coastal plain. Except for the territory about Whittier and Downey, the greater portion of the land is supplied from pumping plants and artesian wells. The Whittier district is supplied by a number of old ditches taking water from San Gabriel River, near Bartolo Pass. The East Whittier Irrigation Company ditch of later construction supplies 5,600 acres, principally at East Whittier. Twenty small water companies are operating on the coastal plain. Most of these secure water by pumping from wells.

Alfalfa is irrigated five times, and 1 miner's inch for 250 days serves about 3 acres. For fruits and berries 1 miner's inch is sufficient for about 7½ acres. The old ditches on the San Gabriel are owned and operated mutually by the landowners, while some of the smaller water companies are private corporations selling water.

The water rights of the old San Gabriel River ditches are based on appropriation and use; also in most cases on the riparian character of the land served. The summer flow of Los Angeles River below the narrows is very small as all of the surface water and nearly all of the underground water is diverted by the city above the narrows. There is a small surface flow in the lower course of the river, but this is very unreliable and the American Colony ditches are usually dry when water is most needed, so that wells are now being bored to insure a more certain supply for these lands. Since the greater part of the land on the coastal plain is supplied with water from wells there has been very little litigation over water rights outside of the Whittier district. A suit entitled *Arroyo Ditch and Water Company* vs. *San Antonio Irrigating Company,* over the diversion of water in San Gabriel River, begun in 1886, was compromised.

Bartolo Pass is extremely favorable for securing both surface water and underground water, as all the drainage into San Gabriel Valley must pass through this gap. The coastal plain has comparatively little local watershed. The run-off from Puente hills occurs immediately after rains and is of little consequence. That from Santa Monica Mountains adds somewhat to the underground waters of Cahuenga Valley and to Ballona Creek. The rainfall over the coastal plain varies from 12 to 16 inches, being least at the coast and greatest near the hills. The record at Los Angeles for a period of thirty-four years is 15.60 inches. The underground water must be looked upon as the most available source of supply for further development of this region. Cahuenga Valley is to be given opportunity to subscribe for water from the Los Angeles aqueduct for 30,000 acres and there is a possibility of 21,000 acres near Inglewood and 29,000 acres near Redondo receiving water from the aqueduct in case it is not all taken for higher lands.[1] Water supplied from the aqueduct will be at the rate of 1 miner's inch for 7½ acres, or with storage in Franklin Canyon of the Santa Monica Mountains, 1 miner's inch for 5 acres for 250 days. It is probable that the underground waters are sufficient for the irrigation of a portion of the land not now being watered. The largest artesian basin in southern California lies within this plain and good wells can be secured in almost any locality. The artesian area was reduced somewhat in 1905 and 1906 following years of low rainfall, but since that time there has been a slight rise in the level of the underground water. The source of the underground water is the precipitation over the drainage basins of Los Angeles and San Gabriel rivers and it is probable that the winter floods in these streams contribute most to the underground supply. The water which is absorbed by the sands and loose sediment along the streams percolates toward the sea. It is arrested somewhat by the ridge running northwest from Alamitos Bay and a level is maintained on the northeast side of this ridge, which is considerably higher than the level on the side towards the sea. This brings the ground water to the surface of the lowest lands bordering the upper side of the ridge and accounts for the large area of moist soil near Los Cerritos and for numerous marshes in this section. As the artesian area enlarges and contracts with wet and dry periods its upper boundary shifts north and south. At one time the upper edge of the area was as far north as the Laguna between Los Angeles and Whittier, but at the present time it extends no farther north than Norwalk and Downey. The area includes most of the country about Compton, Clearwater, and Artesia and extends towards the southeast across the Orange County line, where there is an area about as great as that in Los Angeles County. In general, flowing wells are secured by boring into strata from 200 to 700 feet in depth. Near Artesia wells 200 feet deep do not as a rule flow all summer, but wells 600 feet deep continue to flow throughout the dry season. A new well 700 feet deep one mile east of Norwalk gives a discharge of 20 miner's inches, a large portion of the water being from a stratum about 400 feet in depth. The Compton wells, from 300 to 700 feet deep, flow following years of good precipitation, but they must be pumped during dry periods. The water stood from 6 to 8 feet below the surface in 1912. Wells 150 feet deep in this locality flowed 25 years ago. At Fruitland, just south of Los Angeles, at an elevation of 200 feet, the water stands at a depth of 60 feet from the surface in wells bored to a depth of 300 feet. The artesian area at one time reached this locality, but its northern limit is now about 8 miles to the south. Near Downey, in a new well 171 feet deep, the water stands at 7 feet below the surface and is pumped down an additional 18 feet when discharging 100 miner's inches. Wells 700 feet deep in the same locality are flowing. The well of the Santa Gertruda Water Company, near Los Nietos, is 700 feet deep and requires a lift of 30 feet when pumping 200 to 300 miner's inches. In the area directly east of Los Angeles and north of the Laguna water must be lifted from 10 to 50 feet by pumps, the wells being 500 or 600 feet in depth. About Gardena and Inglewood wells are bored from 150 to 600 feet in depth. The water usually rises to within from 50 to 65 feet of the surface. The depth of wells in Cahuenga Valley is as follows: Near Santa Monica 75 to 150 feet, near Sawtelle 75 to 200 feet, near Ballona 100 to 300 feet, and near Hollywood 150 to 300 feet. Wells for irrigation usually deliver from 50 to 100 miner's inches of water each. A well 912 feet deep on the American Colony lands north of Long Beach delivers 75 miner's inches when pumped. Water stands at 5 feet below the surface. The fluctuations in the ground water level seldom exceed 20 feet in one year. In most localities the water level is higher in winter than in summer, a noticeable rise beginning in August.

---

[1] Report of Advisatory Engineers on distribution of water from Los Angeles Aqueduct.

The land about Whittier and Downey is already highly developed, although extensions of the citrus orchard district are encroaching on the foothills. The principal reason why development has not been more rapid in some localities is that all the land being in Spanish grants has been acquired in large tracts by companies and held at high prices.

The central portion of the plain is not so desirable for residences as the terraces bordering the Santa Monica Range and has been more strictly on an agricultural basis. A large area of moist land near Long Beach needs drainage to make it highly productive and profitable. Some of this land is now producing sugar beets but with drainage more valuable crops could be grown. Where there is much alkali drainage alone may not be sufficient to reclaim the land, but the leaching of the soil resulting from irrigation may accomplish the desired result. The Bixby Land Company has tile drained 300 acres with the result that the salt content of the land is much reduced. Portions of the coastal plain are adapted to alfalfa and dairying and there is a ready market for dairy products.

Summary for Los Angeles and San Gabriel River Lands.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
San Fernando Valley	110,500	10,010	105,000	Los Angeles aqueduct, storage on Tejunga River and underground waters.
San Gabriel Valley	78,636	36,536	70,000	Los Angeles aqueduct, storage on San Gabriel River and underground waters.
San José Creek Valley	10,350	3,401	6,500	Underground waters.
Los Angeles coastal plain	242,500	117,507	200,000	Los Angeles aqueduct and underground waters.
Totals	441,986	167,454	381,500	

SANTA ANA RIVER LANDS.

This division is different from that including Los Angeles and San Gabriel rivers by having its water supply entirely within its boundaries. A miner's inch of water serves 7 to 8 acres of citrus orchard, 10 or more acres of deciduous orchard, and 3 acres of alfalfa in districts at the base of the San Gabriel Range, and 5 acres of citrus orchard at Redlands and Riverside. That production has not been lessened by lack of water is shown by the large shipments of citrus fruit and by the high market value of alfalfa ranches.

Values are not so much affected by city suburban influences as in the division embracing Los Angeles and San Gabriel rivers, although the Santa Ana division includes choice residential districts. Orchards must produce fair interest on the investment and values are on this basis.

Part of the flood waters of Santa Ana River are already stored in the mountains, but there is opportunity for further improvements of this kind. Much more pumping will also be done from wells along the Santa Ana. The principal thing which remains undetermined is the extent to which pumping in the upper basins will affect the water supply in Orange County. Water rights are based on appropriation and use and filings are regarded as superficial. The litigation on the Santa Ana, of which there has been much, has developed some of the fundamental principles of water rights in California, especially with reference to underground waters.

POMONA VALLEY AND CUCAMONGA PLAINS.

The territory included under this heading is at the southern base of the Sierra Madre Range from San Dimas to Lytle creeks and is limited in area. It is bounded on the south by Chino hills, Jurupa Mountains, and the Santa Ana River. The region embraces several débris fans spreading from small canyons in the Sierra Madre Mountains and which combine to form a gently sloping plain toward the south from this range. The drainage is to Santa Ana River, but the surface flow of the stream does not ever reach the river and the territory is considered apart from the Santa Ana River drainage in the San Bernardino basin. In former years the flood waters of San Antonio Creek sometimes crossed the valley and reached Chino Creek without sinking into the sands and were then carried by this stream to the Santa Ana. The waters of Chino Creek are brought to the surface by the hills which intervene to prevent further passage of underground waters percolating southward from San Antonio Canyon.

This section includes Pomona, Lordsburg, Claremont, Ontario, Upland, Cucamonga, Etiwanda, and Chino. The chief industry about these settlements, except the last mentioned, is the growing and shipping of citrus fruits. The alluvial lands, like those of the San Gabriel Valley, are very coarse in the upper areas below the mountain canyons, the material becoming gradually finer as the low areas by the southern hills are approached. The washes of the streams branch out into numerous gravelly channels below the canyons where some land is so rocky that it is doubtful if it will ever be reclaimed for agricultural purposes even though water should be available for irrigation. Farther away from the foothills the soil is gravelly but is very productive when the boulders and cobbles are removed and water applied. Sandy loams predominate farther down the slope and black adobe is found in the lowest areas. Before the country was developed these adobe lands were very moist and the long continued growth and decay of vegetation blackened the soil. A few mesas or bench lands bordering the foothills differ in character from the gravelly lands about the mountain canyons. These bench lands are reddish in color as contrasted with the decided gray of the wash. Conspicuous among them are the heights about Le Verne and Lordsburg, Indian Hill just above Claremont, and Red Hill northwest of Cucamonga. Alkali is not in evidence except in the low moist lands bordering Chino Creek and Santa Ana River. Several hundred acres south of Chino have been drained by the American Beet Sugar Company for the growing of sugar beets. Drainage has been effective in removing much of the salt. The principal purpose of drainage, however, was to rid the land of its moisture in order that early planting of beets might be practiced. The soil, too salty for ordinary crops, would produce sugar beets without drainage. The slope of the land is very steep near the base of the mountains, averaging 200 feet per mile. The lower part of the valley has a fall of only about 50 feet per mile. Practically all of the upper lands are planted to citrus fruits, the orchards being in almost solid areas wherever water can be secured for their irrigation. In the southern and southeastern portion of the division, where the soil is too tight and the frost too severe for the growing of citrus fruits, the crops consist principally of alfalfa, deciduous fruits, English walnuts, sugar beets, berries, and garden truck. The eastern portion of this territory is the least developed, there being little or no water for irrigation. The Italian and other vineyards occupy several thousand acres of sandy soil from Cucamonga and Etiwanda southeast to Jurupa Mountains. Portions of this section which are without water for irrigation, not planted to grapes, are utilized for grain. Orchards are usually about 10 acres and alfalfa ranches from 20 to 80 acres. A large portion of the lower plain is occupied by the Chino grant on which there is 19,000 acres of tillable land. This grant, after passing into the hands of American owners, was under mortgage for a number of years, preventing sale of the land and causing settlement to be slow compared to other places in southern California with equal opportunities. In 1906 the indebtedness against this property was cleared and since that time development which had previously been begun around Chino has extended rapidly toward the south and east until at the present three fourths of the land is occupied.

The chief source of water for irrigation, especially at Pomona and Chino, is the underground supply. All of the summer discharge from the mountain canyons was appropriated and used years ago. After first satisfying an old right, the summer discharge of San Antonio Creek is divided about equally between Pomona and Ontario up to a total 624 miner's inches, in accordance with a court decree. The waters of Cucamonga Canyon are diverted and used by the Cucamonga Water Company and those of Etiwanda and Day canyons by the Etiwanda Water Company. Besides the surface water the subterranean flow of all these canyons is drawn upon by means of tunnels which have been driven into the gravels. The greater portion of the land about Ontario and Upland is under the system of the San Antonio Water Company, which serves approximately 5,000 acres. The canyon water, however, has been supplemented by a goodly supply from pumping plants. The Canyon Water Company uses the greater part of Pomona's share of canyon water, the Irrigation Company of Pomona and Del Monte Irrigating Company depending on water from wells. The following companies supply water to lands in this area:

At Pomona, Claremont, and Lordsburg:

Canyon Water Company, of Pomona.
Irrigation Company of Pomona.
Del Monte Irrigation Company.
Palomares Irrigation Company.
Kingsley Tract Water Company.
Currier Tract Water Company.
Orange Grove Tract Water Company.
Packard Water Company.
Mills Tract Water Company.
Old Baldy Water Company.
Mesa Land and Water Company.
La Verne Land and Water Company.
Live Oak Water Company.
Citrus Water Company.
Illinois Land and Water Company.
Richards Irrigation Company.
Indian Hill Water Company.
Claremont Coöperative Water Company.
Pomona Ranch Water Company.
Harrison Avenue Water Company.
Monte Vista Water Company.
Monte Vista Irrigation Company.
Mont Antonio Water Company.

At Ontario and Upland:

San Antonio Water Company.
Mountain View Water Company.
Ontario Water Company.
Canyon Ridge Water Company.
Upland Water Company.
Ranchers Mutual Water Company.

At Cucamonga:

- Cucamonga Water Company.
- Old Settlers Water Company.
- Hermosa Water Company.
- Iamosa Water Company.
- Sunset Water Company.

At Etiwanda:

- Etiwanda Water Company.
- Rochester Water Company.

At Chino:

- Chino Water Company.
- Southern California Colonization Company.

Most of the foregoing secure water from pumping plants, and about 400 pumping plants owned by individuals in addition to those of the water companies are operating. Water is conveyed by underground concrete pipe. The amount used in orchards varies, but averages about .8 acre-foot per acre for citrus trees and less for deciduous trees, 1 miner's inch flowing continuously through the irrigating season being sufficient for 8 acres of citrus orchard. The alfalfa growers on Chino ranch depend entirely on pumping plants and wells for water. The distributing systems for alfalfa are of underground concrete pipe while the method of applying water to the land is by detachable galvanized iron surface pipe. Ordinarily 6 crops of alfalfa are cut, the first as a rule being produced without irrigation by the moisture retained in the soil from the spring rains. Measurements of the amount of water used in irrigating alfalfa made in 1905 and 1908 show an application of 2.4 acre-feet per acre. The mean annual rainfall at Claremont for a period of 18 years is 16.95 inches. This rainfall, while high for an arid or semi-arid country, is poorly distributed, the greater part falling in the late winter and early spring. Canyon water has a capitalized value of $1,500 to $2,500 per miner's inch while pumped water is valued at $1,000 per miner's inch. Acre water rights in mutual companies pumping water are worth about $125 while those having some of the best established rights to canyon water are worth about $300 each.

The rights of most of the appropriators of canyon water have been determined through litigation although recently a suit was filed which involves both the rights to use surface and underground waters from San Antonio Canyon. This district has been unusually free from litigation over underground waters in the past, considering that there are so many pumping plants and wells.

It is remarkable that about 20,000 acres are irrigated with the surface and underground waters from a mountain watershed of only 40 square miles. The drainage basins of the streams in this division lies within the Angeles forest reserve, San Gabriel Mountains culminating in Mount San Antonio with an elevation of 12,000 feet above sea level.

Snow remains on the higher peaks throughout the late winter and spring, the last of it sometimes not disappearing until midsummer. The canyons are so precipitous that no sites of large capacity for storage reservoirs are to be found for the impounding of flood waters. One small dam has been constructed across Evy Canyon, a branch of San Antonio Canyon, by North Palomares Irrigation Company. Many small concrete reservoirs are in use throughout the valley in connection with pumping plants. These reservoirs are entirely artificial and merely act as regulators in the distribution of water. Brown's Flat, located in the San Gabriel Mountains west of San Antonio Canyon, has been investigated as a storage site but was not given further consideration on account of the high cost.

Effective work has been done in the spreading of storm waters below the mouth of San Antonio Canyon over the coarse gravels where they are absorbed and stored in the underground basins to be drawn on later by the pumps taking water from wells. In the absence of suitable storage sites this is the best means for conserving flood waters resulting from the melting of the snow in the spring at a time too early for direct use on the orchards. The maximum discharge of San Antonio Creek is estimated at 100,000 miner's inches or 2,000 second feet. Floods of this size do not occur every year. The average summer discharge for a 22-year period as shown by the measurements of water companies is as follows: July 820 miner's inches, August 738 miner's inches, and September 557 miner's inches. The other streams entering the valley are much smaller.

The underground waters of the citrus districts have been drawn on so heavily by pumping plants that is doubtful if new wells can be made that will not affect the supply from existing wells. On Chino ranch the water level has not been seriously affected by pumping and it is probable that many more wells can be made in this section without serious damage. Water which is absorbed along the base of the foothills above Upland, Cucamonga, and Etiwanda percolates in a general southerly direction. Water entering the gravels below San Antonio Canyon is in large part forced to move to the southwest by what is evidently an extension of San José hills now buried by alluvium. Wells drilled in the cienegas at Claremont and Pomona flow following periods of good rainfall but the water must be lifted in them from 50 to 100 feet during dry periods. Below these cienegas are wells in which water must be lifted from 100 to 400 feet. A vast water plane with slope toward the south much less than that of the surface appears to be south of Ontario. The pumping lift is about 100 feet at the northern border of Chino ranch. An artesian area which varies in size with wet and dry periods borders Chino Creek. It now occupies about 20 square miles. Many new pumping plants have been installed on wells in the eastern part of Chino ranch within the past few years and some single wells are producing 200 miner's inches. Wells near the foothills as a rule do not produce over 50 miner's inches.

It is probable that all of the alfalfa district can be irrigated from wells but it is doubtful if there can be any material increase in the citrus districts without an overdraft on the underground supply for these upper lands. Water is already used in these districts with as much economy as can reasonably be expected and it is doubtful if there will be any increase from a more economical use. Pomona Valley and Cucamonga Plains contain 131,448 acres of agricultural land, of which 44,823 acres are irrigated. The total mountain watershed contributing to this territory is 56.9 square miles, over which the precipitation is estimated at 20 to 40 inches annually.

All of the normal flow from San Antonio Canyon is used for the development of electric power before being used for irrigation. The plants of the Pacific Light and Power Company and the Ontario Power Company are located in the canyon. The water from these is returned to the creek above the diversion of the Pomona and Ontario water companies. A portion of Ontario's share is again used in the plant of the Ontario and San Antonio Heights Power Company before it is used for irrigation. The use of water for power is not in conflict with its use for other purposes.

SAN BERNARDINO VALLEY AND RIVERSIDE.

This area contains more irrigated land than any other within the coastal drainage of southern California. Although it lies in two counties, it is considered as one area on account of the common water supply. The supply is Santa Ana River and tributaries, in the San Bernardino Basin, above Colton. The principal tributaries are Lytle and Mill creeks, but Cajon Creek, Devil's and Waterman canyons, Twin, City, and Plunge creeks also discharge into the basin. Warm Creek rises from springs in the cienegas of the basin and flows into Santa Ana River. The Santa Ana has no other important tributaries until Rincon is reached, where Temescal wash and Chino Creek enter the river.

The agricultural lands may be divided into four main divisions. The country north of Jurupa Mountains and west of Lytle Creek, including Rialto, Bloomington, and Colton, contains 48,576 acres, of which 14,250 acres are irrigated. The central portion of the basin, between Lytle Creek and Santa Ana River, including San Bernardino and Highlands, contains 37,817 acres of good land, of which 13,862 acres are irrigated. The Redlands district, lying south of the Santa Ana River, has 21,830 acres of agricultural land, of which 16,080 acres are irrigated. Riverside Valley and Mesa contain 92,300 acres, and 35,800 acres are irrigated. The totals are: Agricultural land 200,523 acres, and irrigated land 79,992 acres.

In general, soils are sandy loams of different grades. The mesa soils of Riverside and Redlands are red and rather heavy, but they contain some sand. Adobe is found in some of the low areas in the San Bernardino Basin and along the river in the vicinity of Arlington. The washes of the Santa Ana River, Lytle and Cajon creeks occupy large areas and it is doubtful if much of this land will ever be reclaimed. Some gravelly soil is found along the base of the San Bernardino Mountains and north of Rialto. Soils near Wineville are very sandy. Alkali does not appear in quantities that would be damaging to plant life.

Farms are small where the land has been subdivided, the common size of an orchard being 10 acres. Alfalfa ranches contain from 80 to 160 acres. This area includes, however, several large properties, such as the Arlington Heights groves, under company ownership, 1,500 acres in extent, and several others of several hundred acres. A number of large tracts, usually Spanish grants, which have been acquired by land companies, are being subdivided and colonized. It is customary for the land and water companies to develop water for irrigation, organize subsidiary mutual water companies, and sell the land in small tracts, together with water rights in the mutual companies, to settlers. Tracts of this kind are in West Riverside, and at Fontana, near Rialto.

The value of a right to pumped water is $1,000 to $1,500 per miner's inch, and of gravity water, under company systems, with well-established rights, $2,000 to $3,000 per miner's inch.

Practically all of the upper lands of this area are devoted to citrus fruits. The mesa and higher valley lands have comparatively little frost and soils are medium as regards texture, being neither light nor extremely heavy. Riverside, Highgrove, Arlington, Redlands, Highlands, and Rialto are among the most important citrus districts of southern California.

Highlands and Rialto grow lemons, as well as oranges. Colton, Bloomington, and West Riverside districts are also adapted to citrus fruits. Olives have given excellent results near Bloomington. Alfalfa is grown in the basin below San Bernardino, Highlands, and in Riverside Valley. The section about Wineville is in vineyard. Some deciduous fruit orchards are scattered throughout the territory, where the land is not adapted to citrus culture. Large areas of grain occupy the slopes of the surrounding hills and some of the valley land about San Bernardino and north of Jurupa Mountains where water for irrigation has not yet been provided.

All of the normal surface waters of the streams entering San Bernardino Valley are diverted directly by water companies. Most of the streams discharge throughout the summer. Water absorbed by the gravels below the stream canyons has been collected in the bottom of the basin and a high level of underground water is maintained by Bunker Hill and its extensions, now buried by alluvium. An artesian area, which was originally about 32 square miles, is located in the basin. This section is one of the most valuable for producing underground water thus far found in southern California. Heavy drafts have been made on the underground waters for the past twenty years, and during the dry period ending about 1904 there was a decline in the water level, measuring from 10 to 30 feet in the various wells. Years of better rainfall followed this period, and for a time after 1906 the level was maintained. The draft on the supply, however, increased with new wells, the most of which were both larger in diameter and deeper than the older wells, and within the last two or three years there has been an additional slight decline in many wells. The artesian area occupied about 13 square miles in 1904.[1] Some of the new wells are from 800 to 1,000 feet in depth, and some along Lytle Creek and near San Bernardino are claimed to produce between 100 and 200 miner's inches. Many wells outside of the artesian area are pumped, as are some of them that flow slightly. The springs and flowing and pumped wells of the San Bernardino Basin have furnished a large portion of the water for irrigation for the Riverside citrus district during the dry season when water is most needed. Many pumps are also operating on wells in the Riverside Valley. The draft on the underground water in this locality is in general a later development than that in the upper basin. All of the surface waters of the Santa Ana are first taken out at the mountain canyon for use at Redlands and Highlands. The subterranean flow is brought to the surface near Colton and water is here diverted by the Riverside canals. They are again brought to the surface above the Riverside Narrows and the water level is at or near the surface at many points in the lower Riverside Valley. All unused waters of the upper basins must finally enter the canyon below Rincon.

Nearly all water companies securing water from Santa Ana River are mutual organizations. The Bear Valley Mutual Water Company takes water from Santa Ana Canyon to be furnished several mutual companies of the land owners in the various districts of Redlands and Highlands. Among those supplied are:

Crafton Water Company,
Redlands Water Company,
Redlands Heights Water Company,
East Redlands Water Company,
West Redlands Water Company,
Mentone Irrigation Company,
Lugonia Water Company,
Gladysta Mutual Water Company,
Barton Pipe Line and Water Company,
Bear Valley Extension Water and Pipe Line Company,

with lands on the south side of the river; and

North Fork Water Company,
West Highlands Water Company,
Cram-Van Leuvan Water Company,
Green Spot Pipe Line Company,

with lands on the north side of the river.

Formerly these mutual companies purchased water from the Bear Valley Irrigation Company, a corporation which failed financially and went into the hands of a receiver. Its property was acquired by the Bear Valley Mutual Water Company, organized by the water users.

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 142.

Other Redlands water companies are:

Mill Creek or Old Town Water Users,
East Barton Water Company,
Jewel Water Company,
Gladysta Well and Water Company,
South Mountain Water Company.

Some of the Redlands companies are interrelated by one company owning stock in another and by exchanges of water and rights. For example, the Crafton Water Company exchanges water from the Santa Ana with the Old Town Water Users, for water from Mill Creek.

Companies with lands near San Bernardino are:

Del Rosa Water Company,
West Twin Creek Water Company,
City Creek Water Company,
McKenzie Ditch Company,
Stout Ditch Company,
Rabel Dam Ditch,
Hawes Ditch.

The Del Rosa Company takes water from East Twin Creek and the McKenzie and Stout ditches from Warm Creek.

The following companies receive water from wells and pumping plants in the vicinity of San Bernardino and Colton:

Rancheria Water Company,
Terrace Water Company,
Rosedale Water Company,
North Colton Water Company,
Linda Vista Water Company,
Vista Grande Water Company,
Jumal Water Company,
Merryfield Water Company.

Lands at Rialto and Fontana are supplied by the Lytle Creek Water and Improvement Company, Fontana Water Company, and Mt. Vernon Water Company, with water from Lytle Creek and from pumping plants. Lands near Bloomington are supplied by the Citizens Land and Water Company.

The Riverside Water Company supplies 8,658 acres of Riverside Valley lands. It is mutual in some respects. Water is secured from Santa Ana River, Warm Creek, and flowing wells near Colton, with a supplemental supply during the dry season from pumping plants in the river. The Gage Canal Company and its subsidiary company, the East Riverside Water Company, are mutual companies, serving the upper mesa or citrus lands, including East Riverside and Arlington Heights. Water for this canal is received from Santa Ana River and flowing and pumped wells above Colton. The Riverside-Highlands Water Company is strictly a mutual organization, serving the citrus orchards of the terrace south of Colton. Water is secured from flowing wells in the Colton basin and from pumping plants along Lytle Creek, it being lifted to the mesa by large pumping engines. The Jurupa Ditch Company secures water from the Santa Ana River, and the Alvitrez Ditch Company from Spring Brook. The Rivino Water Company secures water from pumping plants.

The following mutual water companies, some of which are related as regards stock ownership, are entitled to water from the river, or have wells and pumping plants, but have water carried by the canal of the North Riverside and Jurupa Canal Company:

Meeks and Daley Water Company,
West Riverside 350 Inch Water Company,
La Sierra Water Company,
Sunny Slope Land Company,
Alta Mesa Water Company,
Union Water Company,
Salazar Water Company.

The distribution systems of water companies consist of cement or concrete lined canals, and cement and steel pipe. The Bear Valley Mutual Water Company used some redwood stave pipe for many years in Santa Ana Canyon, above the cement-lined canals, but the wood pipe is now being replaced with concrete. The Gage canal, 20 miles in length, is lined throughout with cement plaster, three fourths of an inch thick. The greater part of the Riverside Water Company's canals are lined. Steel pipe has been used for conduits under pressure; also for lateral lines under some of the systems.

Orchard irrigation systems are of cement concrete head flumes or underground pipe, with stands. Alfalfa is irrigated with detachable galvanized iron surface pipe and by flooding from open unlined field ditches and field borders. Power for pumping is usually furnished by electric motors or gasoline engines.

The duty of water for citrus fruits, stated in terms of depth on the land, varies in general from 1 to 2 feet; the higher figure being for systems receiving all or part of the water by gravity and with winter irrigation, and the lower figure for orchards where all of the water is pumped from wells and without much winter irrigation. The duty may also be stated as 1 miner's inch for 5 acres of citrus fruits at Riverside and Redlands. Under the Fontana system at Rialto, 1 miner's inch serves 7 acres of citrus orchard. A miner's inch is sufficient for 2 to 3 acres of alfalfa in San Bernardino basin and Riverside Valley, and the quantity of water applied to alfalfa is from 2 to 5 acre-feet per acre. Water is delivered to orchards by rotation under a thirty or forty-five day schedule. The rainfall at San Bernardino is 15.92 inches, at Redlands 14.94 inches, and at Riverside 10.46 inches, most of it occurring in late winter and in spring.

The principal areas where drainage is needed are along the Santa Ana River near Arlington and in the upper basin. Lower Riverside Valley lands have been damaged to some extent by return seepage water from the higher lands. Preparations are being made to drain some of this land.

Some of the older ditches, such as those at Redlands, have been given fixed amounts of water from the streams by the courts. In general, rights have been adjudicated frequently, yet new cases of litigation are continually coming up, due to extended operations of the older companies, and to new appropriators entering the field. Companies have been desirous of owning riparian land, to strengthen their rights. Many companies and individuals claim riparian, appropriation, and prescriptive rights, appropriation being used in the sense of actually applying the water, and prescription with reference to the Statutes of Limitations. Redlands companies have been involved in much litigation in connection with the failure of the Bear Valley Irrigation Company, as well as over water rights in Santa Ana River. Several irrigation districts were organized under the State law in the eighties and all failed. Some of the litigation coincident with these failures, as in the case of the Rialto and Grapeland districts, was yet in the courts a few years ago. The courts have been called upon to settle questions of right to use water from the river, between the Orange County and the Riverside County canal companies. One of these important cases was compromised and withdrawn from trial. Questions have also arisen between the Riverside and San Bernardino County water users. Recently suit was brought by Riverside to restrain the Bear Valley Mutual Water Company from storing additional water in their new reservoir in the mountains. Litigation over rights to use underground waters and to convey underground waters to distant lands has followed as a result of the Riverside companies securing water from San Bernardino basin. The governing principles of late decisions relating to the use of underground waters were first laid down by the Supreme Court of the State, in *Katz* vs. *Walkinshaw*. A later decision in *Barton* vs. *Riverside Water Company* is more comprehensive. These cases have general application, inasmuch as the same questions may arise in any locality where there are disputes over rights to use underground water.

The Bear Valley Mutual Water Company completed a multiple arch concrete dam, about 85 feet high, costing about $300,000, in 1911, to replace the old Bear Valley dam. The new structure increases the capacity of the reservoir from 26,464 acre-feet to 65,000 acre-feet. Another reservoir site is located on the South Fork of the Santa Ana River. It is reported to have a capacity of 35,000 acre-feet. About 8,000 acres is being added to the citrus district of Rialto by further development of water in Lytle Creek Canyon and by boring of wells and installation of pumping plants by the Fontana Development Company. Large areas of land are being reclaimed on La Sierra Heights and in the West Riverside district by companies and individuals. The decision of the court in a late case brought by the Orange County water companies to stop the pumping of underground water from new wells was decided in behalf of the defendants. This will probably encourage pumping in the upper basins. An abundance of underground water is available, but it is difficult to estimate the amount that can be pumped without reducing the supply for Orange County. The discharge of the river at Riverside narrows and at Rincon has held up well during the dry season in late years, notwithstanding the increased diversions in the upper basins, and it appears that return waters from irrigated land have in a measure the effect of regulating the summer flow of the river.

The Gage Canal Company is now constructing a dam across Mockingbird Canyon to store flood waters.

Storm waters from Santa Ana Canyon and Mill Creek are spread over the gravels north of Redlands with good effect, by the Riverside and Orange counties water companies. From 10,000 to 12,000 miner's inches for about 100 days are diverted from the streams and put into the gravels when the snow is melting in the mountains. At the request of the association conducting this work, the Government has reserved 1,100 acres of land below Santa Ana Canyon for the use in storing flood waters. The work has been very beneficial in maintaining a high level of ground water in the San Bernardino basin, and in increasing the supply to users below. The president of the association has estimated that the supply to the Riverside canals alone amounted to 1,000 miner's inches last year. The level of the underground water was 6 feet higher than in previous years. Flood waters are also spread over gravels at the mouth of Lytle Creek Canyon, by the Fontana Development Company. The method employed here has varied somewhat from that employed in other localities of southern California. Water diverted from the stream channel is conducted to vertical shafts excavated in the gravel of the débris fan to depths of 50 feet or more.

The mean annual discharge of the Santa River near Mentone, from 1896 to 1910, was 59,200 acre-feet.[1] The river has 483 square miles of mountain watershed above Colton. It is estimated that the area irrigated in this territory may be increased 10,000 acres from further development of underground waters, and an additional 10,000 acres by storage in the mountains. It would be possible to deliver water near San Bernardino from Arrowhead reservoir, located in the Mojave River drainage, by tunnel through the San Bernardino Range. This disposition of the water has been considered, but the indications at present are that the stored water will be used on the northern side of the mountains. This reservoir will furnish sufficient water for the irrigation of about 15,000 acres of orchard.

Electrical power is developed in Santa Ana, Mill, and Lytle canyons. Power development is all above diversions for irrigation, and the two uses do not conflict. Power is also developed by the Riverside Water Company and at a plant between Arlington and Corona.

YUCAIPA VALLEY AND SAN GORGONIO PASS.

San Gorgonio Pass is between the San Bernardino and San Jacinto mountains and connects San Bernardino Valley with Coachella Desert. The elevation of the divide is 2,500 feet. Yucaipa Valley is at the base of Mt. San Gorgonio and has a mean elevation about the same as the pass. It is connected to the pass near Beaumont and is separated from Redlands by Crafton Hills. The pass includes 24,400 acres of tillable land, sloping to the west, and 29,200 acres sloping to the east. The area irrigated is 5,230 acres, the greater part being near Beaumont and Banning. Yucaipa Valley contains 18,400 acres, of which 2,500 acres are irrigated.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

The water supply of San Gorgonio Pass is from San Gorgonio, Little San Gorgonio, Noble, Potrero, and Millard creeks, all from San Bernardino Mountains. Little San Gorgonio and Noble creeks drain towards San Timoteo Canyon, while the others drain eastward to the Whitewater. The northern slope of the San Jacinto Mountains is more precipitous than the southern slope of the San Bernardino Mountains, and there are no streams from the south that furnish any material amount of water for irrigation. The streams are torrential in character, although most of them discharge some water throughout the year. The normal flow, if not diverted for irrigation, would all be absorbed by the gravels. The gravelly channels of the washes indicate that flood waters sometimes cross the land, the wash of San Gorgonio River especially being evident. The eastern end of the pass drains to Coachella Desert and Valley and Salton Basin by way of Whitewater River. The western drains through San Timoteo Canyon to San Bernardino Valley.

The streams entering Yucaipa Valley are Potato, Water, and Wildwood canyons. The valley is drained by Yucaipa Creek to San Timoteo Canyon. The valley and pass are visited with too much frost for the growing of citrus fruits, but they are adapted to apples, pears, cherries, figs, and other deciduous fruits, while almonds have been grown successfully. The summers are cool, owing to the elevation and the proximity of snow-capped mountains. There is a marked change in temperature at the eastern end of the pass, where it partakes of conditions prevailing on Colorado Desert. The difference gives rise to winds which rush through the pass from the coast region to replace the heated atmosphere of the desert. The winds become more pronounced toward the east, where they render this end of the pass, together with the desert beyond, almost useless agriculturally.

Soils in the pass range from sandy loam to gravel. Some of the unimproved land near Cabezon is held in large tracts, but most of the improved land is in tracts of about 20 acres.

The upper or bench lands of Yucaipa Valley are of sandy loam, sloping 200 feet per mile to the west. The lower, and more properly the valley lands, are loamy. Ground water is brought to the surface in the lower area and good wells are secured by boring to comparatively shallow depths.

Apples are grown in Potato Canyon and miscellaneous crops in lower Yucaipa Valley, but the major portion of the valley has produced nothing but grain for many years. The South Mountain Water Company of Redlands developed water in canyons above the valley, and after using the water for five years, suit was brought by the Yucaipa Land and Water Company, owners of the Dunlap ranch, to stop the taking of water to Redlands. The court limited the South Mountain Company to fifty-two and one half miner's inches. In 1910 the Redlands and Yucaipa Land Company acquired the property of the Yucaipa Land and Water Company, including the Dunlap ranch. The South Mountain Company now receives the amount awarded by the court from the system of the Redlands and Yucaipa Company and from wells in the lower valley in exchange for rights in the mountain canyons. The Redlands and Yucaipa Company is increasing its water supply by further developments in the canyons with tunnels and wells, and has constructed a small storage reservoir commanding their distributing system of underground pipe. The water supply, if all conserved, is claimed to be sufficient for 11,000 acres on the basis of 1 miner's inch for 10 acres.

The Beaumont Land and Water Company supplies 1,900 acres with water from Edgar and Noble canyons, 2 artesian wells, and 3 pumped wells. The total maximum supply is approximately 450 miner's inches. Water from the canyons is conveyed in steel pipe, there being a total of 50 miles of pipe including the distributing system. The steep grade of the main conduit allows 65 electrical horsepower to be generated for pumping water from wells. The Banning Water Company takes water from San Gorgonio Creek by means of a small concrete dam and 8 miles of ditch, lined with rubble masonry, and with a capacity of 900 miner's inches. The main conduit leads into 2 small concrete-lined reservoirs situated above a distributing system of steel pipe. The Malone Land and Water Company is at present irrigating 180 acres near Cabezon from Millard Canyon. Water rights are based on the long-continued use of water and on riparian land.

The Beaumont Land and Water Company allows 1 miner's inch for 10 acres. The land irrigated is principally in young deciduous trees. The practice under the Banning system is to use 1 miner's inch for 6 to 7 acres of deciduous orchard.

The Consolidated Reservoir and Power Company is at present constructing a ditch to convey water from Whitewater River to lands near Banning, a distance of 6 miles. The water will be diverted at an elevation of about 7,000 feet and opportunity will be given to develop a large amount of electric power before the water is used for irrigation. The conduit will have a capacity of 900 miner's inches. In addition to this conduit, a storage dam is to be constructed in Whitewater Canyon. As the discharge of Whitewater River is all absorbed in its attempt to cross Coachella Desert, and as undoubtedly this stream is the source of the underground water in Coachella Valley, diversions from Whitewater Canyon for lands in San Gorgonio Pass will probably affect the water supply of Coachella Valley. Irrigators at Coachella are protesting against the contemplated diversion by the Consolidated Reservoir and Power Company.

Of the watershed draining directly into San Gorgonio Pass that going westward is 50 square miles, practically all of it being on the north side. That drainage eastward is 145 square miles, that on the north side, 82 square miles, being the most valuable for water supply. The rainfall at Beaumont and Banning is about 16 inches and that in the mountains is much greater.

Storm waters from San Gorgonio Creek have been spread over the gravels of the wash below the canyon with good effect. The average flow of this stream is reported to be 550 miner's inches. It is the largest stream entering San Gorgonio Pass.

It is hardly probable that more than one fourth of the land in San Gorgonio Pass will be irrigated. Some increase should take place from further draft on the underground waters. Most of the wells now existing are located along the north side of the pass near Beaumont and Banning. Some of these flow and others must be pumped. In a new well drilled by the Beaumont Land and Water Company, the water began to flow on reaching a depth of 72 feet below the surface. Another well of this company in Edgar Canyon discharges 55 miner's inches, the water being lifted over 200 feet. The area to be irrigated in Yucaipa Valley is 11,000 acres.

SAN JACINTO VALLEY AND CORONA.

San Jacinto River drains the southwestern slope of San Jacinto Mountains and after crossing a broad valley somewhat broken by hills, empties into Lake Elsinore. In periods of high precipitation the lake overflows by way of Temescal wash to Santa Ana River near Corona. The chief areas of agricultural land in this drainage are San Jacinto Valley proper, including the territory around San Jacinto, Hemet, Winchester, Lakeview, Perris, and Moreno, the mountain valleys south of the main basin, the valley adjacent to Lake Elsinore, the rolling land of the El Sobrante ranch, and the Corona citrus district. San Jacinto Valley is higher than Riverside and is separated from it by hills. The areas of agricultural land and irrigated land are: San Jacinto Valley, agricultural 249,700 acres, irrigated 23,112 acres; Corona, agricultural 18,500 acres, irrigated 6,750 acres.

Most of the soils of San Jacinto Valley are loams, containing some sand and gravel in places. Some adobe is found and some alkali in low places, such as near Mystic Lake northeast of Lakeview. Most of the mesa soil is reddish in color and resembles the lands of Riverside and Redlands. Hardpan is present in some localities. The El Sobrante grant contains 21,000 acres of good land. The Corona mesa is sandy loam adapted to citrus culture and sloping to the north at the unusually high rate of 300 feet per mile. Most of San Jacinto Valley has been producing grain for many years. Orchards are from 5 to 20 acres in extent; alfalfa ranches from 20 to 200 acres; and grain ranches sometimes contain from several hundred to several thousand acres.

Water for irrigation is furnished users at San Jacinto and Hemet at fixed rates, by public service companies. The Citizens Water Company, which recently acquired the property of the old San Jacinto Water Company, supplies 2,700 acres of citrus and deciduous fruit orchard near San Jacinto, and the Lake Hemet Water Company, and Fairview Land and Water Company supply 5,300 acres of orchard land near Hemet. The Hemet system receives water from the Lake Hemet dam on the South Fork of the San Jacinto River. This structure is 125 feet high, of masonry, and the reservoir has a capacity of 8,000 acre-feet. The Citizens Water Company secures water from a perforated collecting pipe or gallery in the mouth of San Jacinto Canyon, and from wells. The duty of water under the Citizens and Hemet systems is 1 miner's inch for 5 acres. Water is conveyed through cement pipes and cement-lined ditches.

The rate under the Citizens company is $3 per acre per year and under the Lake Hemet Water Company $2 per acre per year. The rate of the Lake Hemet Company has not paid operating expenses and it will probably be raised.

The Moreno Valley Water Company supplies water from wells to 400 acres near Moreno and water is conveyed from Mill Creek near Redlands to 450 acres near Allesandro through Allesandro pipe line. Aside from these water companies there is much irrigation from private plants scattered throughout the valley, although the greater number are near San Jacinto and Elsinore. Alfalfa is the principal crop irrigated from pumping plants. Olives and English walnuts have been grown near Elsinore and Wildomar in late years. The olive is the only unirrigated crop aside from grain.

The companies at Corona are mutual organizations. The Temescal Water Company furnishes water for 4,682 acres of citrus lands. The water is secured from branches of Temescal Canyon, twelve pumped wells in Perris Valley, and one flowing well. Electric power is generated at a steam power plant near Ethenac and transmitted to the pumping stations. Water is conveyed by two pipe lines by way of Temescal wash to Corona. One miner's inch has a value of $1,000 and serves 5 acres under the Temescal system. The cost of water to the user is $24 per acre per year. Water is delivered according to a thirty day rotation.

Other companies near Corona are the Foothill Lemon Company and Corona Pumping Company, which secure water from wells. The latter is for alfalfa lands.

The Cajalco Water Company furnishes water for the irrigation of lands on El Sobrante ranch. Water is secured from Cajalco or Hoag's Canyon.

Much of the irrigation of alfalfa in San Jacinto is from pumping plants and artesian wells. An artesian area, originally 14 square miles, stretches northwestward from San Jacinto. The area has contracted at its upper end owing to the drafts made on the basin by wells and to the dry period ending about 1906, but many wells still flow. Where the flow is light, the wells are pumped. The older wells were usually from 100 to 300 feet in depth, but during the last few years some deeper wells have been drilled and these yield good flows. The deepest is 700 feet, which is reported to deliver 65 miner's inches. The artesian basin owes its existence to Lakeview Mountains which intercept the underground water in its passage westward from San Jacinto Canyon. In other parts of the valley underground water is usually found at depths of 10 to 50 feet. Water must be lifted about 10 feet near Perris, while originally it stood practically at the surface of the ground. In other wells about 300 feet deep the pumping lift was 65 feet, in 1912. Water can be secured at depths of about 30 feet, at Moreno, also south of Elsinore. Many wells deliver 100 miner's inches each. Wells near Lakeview are about 200 feet in depth but do not stand much pumping. Underground water has not been found in Diamond Valley.

Several thousand acres of land along San Jacinto River near Lakeview and around Mystic Lake are subject to overflow during the winter and would be improved by drainage. Some alkali is present in these lands, but they have been used for sugar beets and pasture.

The Perris, Allesandro, and Pleasant Valley irrigation districts were organized soon after the passage of the State irrigation district law, but all failed, through insufficient water supply, mismanagement of funds, or other causes. Some of the questions relating to the validity of the bond issues of these districts are yet in the courts. The Lake Hemet Water Company claims all of the flow of the South Fork of San Jacinto River at the Hemet reservoir. The San Jacinto Water Company, which has now been superseded by the Citizens Water Company, purchased the rights of the old Pleasant Valley Irrigation District. The taking of water from Perris Valley for use at Corona led to litigation, in which the Temescal Water Company was limited to 850 miner's inches from this source, by the court.

The Lake Hemet Water Company may increase its acreage to 8,000 acres, provided additional water can be secured from wells. The Citizens Water Company has lately increased its water supply by the drilling of new wells near San Jacinto, and are now in a position to irrigate 4,000 acres, or an increase of 1,300 acres over the present area. A large increase in the irrigated area of San Jacinto Valley may be expected from the development of underground water. Many new wells are being bored and pumping plants are installed every year.

The Superior Land and Water Company expects to be able to deliver about 350 miner's inches from wells and pumping plants near Lake Elsinore for use on a tract of 2,000 acres of land. In 1912 underground water was developed in the cienega two and a half miles above San Jacinto. This cienega has been drawn upon by the collecting gallery of the Citizens Water Company, but its underground waters were not developed by wells until within the past year. It gives promise of yielding a large amount of water which may be used advantageously in the upper portion of the valley. The Ramona Power Company made filings in 1911 on the north fork of the river, Strawberry Creek, and Massacre Canyon. It is proposed to construct a storage reservoir on Strawberry Creek, where a suitable site has been located, and after utilizing the water for the generation of electric power under an 1,800 foot head, convey it to the lands in San Jacinto Valley.

As all of the discharge of the river and its tributaries during the irrigation season is claimed and used, only flood water will be available for storage. Lake Hemet has a drainage area of 50 square miles on the south fork and the capacity of the reservoir is 750 acre-feet and sufficient for the storage of the entire run-off in a normal year. Some years the water overflows the dam. The entire mountain watershed of the river is approximately 700 square miles and that portion drained by the north fork and Strawberry Creek is a much more valuable watershed than that of the south fork.

Water for the rolling land on Rancho El Sobrante de San Jacinto must be secured by pumping from wells. This property has been subdivided and is being colonized. The irrigated area at Corona is being extended by companies pumping water. The Foothill Lemon Company will supply 820 acres.

Lake Elsinore, into which San Jacinto River floods are discharged, has an area of 7 square miles. The waters of the lake, like most inland bodies of water, are too saline for irrigation. The loss of water is equivalent to about 5 feet in depth annually.

Plans have been proposed for the utilization of Lake Elsinore as a storage reservoir and the waters of the lake have been filed upon. Any successful plan involves the reduction of the percentage of salt in the water and it is not certain that this is practicable.

ORANGE COUNTY COASTAL PLAIN AND MESA.

This area includes all of Orange County excepting La Habra which is topographically connected with the Whittier district of Los Angeles County. The largest agricultural area in Orange County is the coastal plain, which is a continuation of the Los Angeles coastal plain toward the southeast. The land has been formed by the alluvium from Santa Ana and San Gabriel rivers, together with marine deposits. The mesa in the southern part of the county differs in character from the coastal plain and valley below Rincon. Other agricultural areas are along San Juan and Trabuco creeks near the San Diego County line. Orange County, though small, has comparatively little waste land. It has a total of 460,000 acres and of this 204,500 acres is classed as agricultural. The main district may be divided into three parts, one of 44,500 acres including valley above the coastal plain, bench lands bordering the hills, and the upper part of the coastal plain itself; a second comprising

80,000 acres of lower land principally in the artesian area; and a third 80,000 acres of mesa land. The upper area is devoted chiefly to the growing of citrus fruits although many English walnuts and some deciduous fruits are produced. The lower coastal plain contains large areas of sugar beets and celery, onions, potatoes, peanuts, alfalfa, corn; some deciduous fruits, and berries are also grown. The main crop on the mesa land is lima beans. Formerly dry-farmed grain was the principal crop. The hills north of Santa Ana Valley constitute one of the important oil-producing fields of California.

Much sandy and silt loam mixed with gravel is in evidence on both sides of Santiago Creek about Santa Ana, Orange, El Modena, Villa Park, and Tustin.[1] A large portion of the plain west of the river and around Anaheim and Garden Grove is classed as sandy loam and sandy adobe. These soils also occur on the mesa southeast of Tustin. South of Santa Ana and Tustin is an area of black adobe. Sand and sandy adobe are found back of Newport Bay and peat occupies limited areas near the ocean. Some of the black adobe soils south of Santa Ana and Tustin and in the marshes southwest of Fairview contain over 3 per cent of alkali. Small areas south of Anaheim and east of the river contain salts in amounts varying from .6 per cent to 3 per cent. The greater portion of the county does not have salts in excess of .2 per cent.

As in other parts of southern California, practically all valley land in this county was originally in Spanish grants. One of these now, the Irvine ranch, contains 109,000 acres and occupies the mesa south of the coastal plain. Holdings in the orchard district average about 10 acres while in the low lands they vary from 10 to 160 acres, 40 acres being common.

Orange County has the Valencia orange and the English walnut among orchard products. All crops in Orange county are irrigated excepting grain and beets. Sugar beets are not irrigated with regularity and grapes are irrigated in dry years only. At one time there was a large area in vineyards but this has been gradually reduced until very few acres are now devoted to that industry. Rotation of crops is much practiced below Anaheim and this often results in a change of the use of water from one tract of land to another from year to year. Some land owners who formerly depended upon shares in water companies have now disposed of their stock and depend upon pumping plants.

The citrus district of Orange County is furnished water by five irrigation systems. The surface water of the Santa Ana is divided equally between the Santa Ana Valley Irrigation Company and the Anaheim Union Water Company at a joint division weir in Bedrock Canyon just below the Riverside-Orange county line. The Anaheim Union canal leads from this weir along the base of the northern hills and covers 8,100 acres of land on the northwest side of the river about Anaheim, Fullerton, and Placentia. The water going to the Santa Ana Valley

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of the Santa Ana Area, Cal.

Irrigation Company follows the river channel for a distance below the division weir before being diverted into the canal. This canal is forced to follow close to the river channel until it has passed the point of hills at Olive. From here laterals branch southward covering 17,200 acres about Orange and Santa Ana, nearly all in citrus and walnut orchards. Both canals are cemented in large part. In late years the flow of both has been augmented by pumping plants taking water from wells near Horseshoe Bend, several hundred miner's inches being developed by each company in this way. The Anaheim Union Water Company secures additional water by pumping wells between Fullerton and Placentia. The Yorba reservoir is used in connection with this company's canal for the storage of surplus water not needed directly for irrigation. This reservoir has not been as serviceable as was anticipated, partially on account of a large loss by seepage, but it is probable that the basin will be lined with cement. The Santa Ana Valley Irrigation Company also has a distributing reservoir on the lines of its canal near Olive which has given good service as a regulator to the distributing system. These two companies use all of the normal flow of Santa Ana River and there are no diversions below their canals. It has been proposed to construct a submerged dam across the river at Sculley's Point as a permanent joint heading for the canals in an endeavor to secure the subsurface flow of the river more completely than is now done. The present weir of the companies is often destroyed or damaged by heavy floods in the winter time and must be reconstructed or repaired at the beginning of each irrigation season. Both companies are mutual organizations, the stock being made appurtenant to the land by the company by-laws. Distributing laterals under these companies are usually small cement-lined ditches. The waters of Santiago Creek, the chief tributary of the Santa Ana, are also divided equally between two coöperative water companies. The Serrano Water Company serves 1,050 acres on the north side near Villa Park and the John T. Carpenter Water Company supplies 750 acres on the south side near El Modena. A submerged dam which is one of the few that intercept all underflow was constructed across Santiago Creek at Point of Rocks jointly by the Serrano and Carpenter water companies. This enables most of the subsurface flow, as well as the surface flow, to be diverted. The water is carried by pipe line to a division box from which point equal parts go to the companies. The only other ditch receiving water from the river or its tributaries is the Yorba ditch which irrigated 627 acres in Santa Ana Canyon. This ditch has the oldest right to water from the river in the county. It is situated below the Anaheim Union Water Company's canal and originally diverted water directly from the river but now receives its supply through the Anaheim Union canal.

The other water companies in this part of the county are small organizations pumping water from wells. The lower part of the coastal plain depends on the underground water for irrigation. Several hundred pumping plants and flowing wells are drawing on the underground supply. The artesian area within the county at one time covered 38 square miles. In general there has been a gradual reduction in the water level during the past fifteen years and in some wells the water is 20 feet lower than formerly. This reduction carries with it a contraction in the artesian area along its upper edge. Here many wells have ceased to flow and must now be pumped while the discharge in some of the lower shallow wells has been diminished. The lowering of the water level has, however, been slight the past four or five years. While shallow wells have a diminished output, deeper wells reaching to lower artesian strata are producing large flows of water. The underground water no doubt comes chiefly from Santa Ana River. That underlying the northwestern portion of the county may come in part from San Gabriel River. The lessened decline since 1906 is due to the heavy precipitation of the late period with increased discharge of Santa Ana and San Gabriel rivers. A new well of the Holly Sugar Company near Huntington Beach reaches a depth of 521 feet and is one of the deepest in Orange County. It produces a good artesian flow. Single wells in Newport produce 75 miner's inches. The majority of the wells are from 150 to 300 feet deep.

Most of the land near the coast required drainage before it was suitable for cultivation. Four drainage districts under the State law have been organized and three of these already have systems in operation. The Bolsa district drains 2,400 acres near Smeltzer and Huntington Beach. Much of this land is peat and now produces the finest quality of celery. The crop for the past year brought the growers in the association $398,155. The Talbert drainage district covers 10,000 acres and the Delhi district 5,000 acres. The Newport district has been organized and will drain 3,000 acres. The section about Alamitos also needs drainage in order that the best results may be secured agriculturally and it is probable that a system will be constructed in due time. Sugar beets constitute the main crop on the low, moist lands and beet sugar factories are located at Alamitos, Anaheim, Santa Ana, and Huntington Beach. Farms are tile drained to connect with the main drainage ditches. In addition to the drainage districts, the Newbert Protection District has been organized for the protection of 1,800 acres of land along the lower Santa Ana by confining the flood waters of the river to the main channel by levees. The large floods of the rainy season, unless controlled, spread over a large area of land and cause damage to property. Some of the alkali lands near the coast have been reclaimed by leaching the salts by flooding the surface in connection with tile drainage.

Water rights in Orange County have been fairly well settled as among the appropriators in the county itself. Litigation was in progress during the early period of the organization of the Anaheim and Santa

Ana companies which continued for a number of years and cost thousands of dollars. The disputes were finally settled by agreement providing for the equal division of water as now practiced. The respective rights of the Serrano and Carpenter water companies to use water from Santiago Creek were established by a decision of the superior court rendered in 1896. In late years trouble arose between these companies and the Irvine ranch owners over the use of water from the creek but a compromise was effected by which the two water companies which had long appropriated and used the water were to have a maximum of 600 miner's inches during five months of the irrigating season and 60 miner's inches for the remainder of the year divided equally between them, and the Irvine ranch was to have the surplus. This leaves the Irvine ranch to depend largely on the winter flood waters and as there is no storage the ranch is not fortunate in having a good water supply for irrigation. About 200 acres are, however, irrigated. The Serrano and Carpenter water companies have for years spread flood waters over the gravels in Santiago Canyon above their joint submerged dam with the result that the subsurface flow reaching the dam is regulated and increased in the dry season, whereas without such spreading the water would run to the sea unused. A reservoir site of about 35 acres in area is in Fremont Canyon, a tributary of Santiago Creek.

The duty of water under the Orange County companies varies from 1 miner's inch for 5 to 10 acres, more water being used on citrus than on deciduous and walnut orchards. Under pumping plants and wells the irrigation is more irregular and as a rule there are a less number of irrigations where the water is pumped than under the gravity systems.

A suit was brought to restrain the pumping of water along the river above Corona, the Orange County companies claiming that the subterranean flow of the river was being drawn upon and that this directly reduced the supply reaching their canals. The court held that the water drawn from the wells was percolating water which saturated lands in the upper basin and that it was not directly connected with the stream and the taking of this water away for use on non-riparian lands was not forbidden.

All of the discharge of Santa Ana River during the irrigating season is diverted and used. All water entering the San Bernardino basin from Santa Ana Canyon is diverted for use in San Bernardino and Riverside counties and some water is pumped in this basin to supplement the flow of the canals. The winter floods store a large quantity of water in the gravels of this upper basin and the river has a large underflow which is well regulated through the summer. The underground water is brought to the surface at several points along the river's course, one being in the pass below Rincon. The underground water receives additions from other streams, such as Temescal Wash and Chino Creek, discharging into the large basin above Rincon. Approximately one half of the supply of the river is diverted in the upper basin near Colton. In late years the summer flow in the lower river has held up better than in former years and this indicates that return seepage waters from irrigated lands in the upper basins have the effect of regulating the flow on the lower part of the stream. The Bear Valley Mutual Water Company of Redlands stores 40,600 acre-feet in their reservoir in San Bernardino Mountains. The underground water level in San Bernardino basin was 5 feet higher in 1911 than in the previous year. The run-off of Santa Ana River depends more on the rainfall in San Bernardino Mountains than on any other watershed.

Miscellaneous measurements of the Santa Ana at Rincon from 1898 to 1906 show a mean discharge of 118 cubic feet per second.[1] It is estimated that fully this amount is being used in Orange County by the canals taking water directly from the river and by the pumping plants and artesian wells. San Juan and Trabuco creeks have a combined annual discharge of from 5,000 to 6,000 acre-feet. This is all used by the Trabuco and Capistrano water companies. No storage sites are reported on these streams.

It is probable that the area irrigated in the county might be increased a comparatively small per cent of the total by a more economical use of water and through greater precaution in preventing waste during the winter. At present 51,000 acres are irrigated in the county, excluding La Habra. This is divided as follows: Citrus district 39,000 acres, low lands of coastal plain 7,000 acres, and mesa lands 5,000 acres.

Summary for Santa Ana River Lands.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
Pomona Valley and Cucamonga Plains	131,448	44,823	55,000	Underground waters.
San Bernardino Valley and Riverside	200,523	79,992	100,000	Storage on Santa Ana River and tributaries and underground waters
Yucaipa Valley and San Gorgonio Pass	72,000	7,730	24,000	Storage on Whitewater River canyons above Yucaipa Valley and undergrounds waters.
San Jacinto Valley and Corona	268,200	29,862	40,000	Storage on San Jacinto River and Strawberry Creek and underground waters.
Orange County	204,500	51,000	60,000	Underflow of Santa Ana River and underground waters.
Totals	876,671	213,407	279,000

SAN DIEGO COUNTY.

In San Diego County, as in Santa Barbara and Ventura counties, the problem of further development is largely one of the storage of flood waters, but a distinguishing feature between this and the upper counties is that the need of irrigation in San Diego County has never been questioned. Here the atmosphere is drier, the summer temperatures higher, and the precipitation and stream discharge less. The discharge is also more erratic, for the more arid the country the greater the variation of precipitation from the normal. The maximum discharge for some years may be several times the normal, while in other years the catchment in reservoirs has been almost nothing. These conditions must be contended with and they account in some measure for flood waters not being completely stored at the present time. Capacity must be provided for the storage of the combined floods of two or three years for the best utilization of the water resources. This makes the stored water costly, but its value for irrigation justifies an unusual expense. Opportunity is given for the development of power, without interference to irrigation, in connection with almost every storage project, and recently investment in storage works has been encouraged by the increasing demand for electrical power as well as by a rise in the value of water for irrigation. Another factor in the development now taking place is the need of San Diego for domestic water. Underground waters have not been fully developed, although they are drawn on more heavily than in Santa Barbara and Ventura counties.

SANTA MARGARITA VALLEY AND FALLBROOK.

Santa Margarita River is most northern of the streams of San Diego County. Part of its headwaters is in Riverside County. Its main branch above Temecula Canyon where the waters pass through the coast range is known as Temecula Creek. The mountain country above the canyon contains small basins with rolling land ranging in elevation from 1,000 to 3,000 feet above sea level. Among them are Temecula, Murietta, French, Los Alamos, Glen Oak, Wilson, Terwilliger, and Coahuilla valleys, situated in Riverside County, and Oak Grove Valley in San Diego County. These mountain valleys are used for grain and pasture. Aside from 600 acres in Temecula Valley, only a few acres are irrigated in the mountain country. The elevation is too great for some crops. The valleys are so near the source of the streams that sufficient water is not available for the land. Water is taken from Temecula Creek for use in Temecula Valley, by temporary dams rebuilt each year. Four flowing wells are located on Rancho Pauba and two are located near Murietta. Alfalfa is the principal crop irrigated.

Santa Margarita Valley is 12 miles long and has an average width of three fourths mile. Much of the land is in grain. Twelve hundred acres of alfalfa on the Home ranch is irrigated from a small storage reservoir in the upper end of the valley. Sugar beets were grown on

150 acres without irrigation in 1912. This valley is rolling and has dark loam soil with a light adobe in places. The land becomes somewhat marshy and alkaline near the coast. The entire valley is a part of the Santa Margarita grant of 260,000 acres not yet subdivided.

The Fallbrook area is devoted chiefly to grain, but small areas of citrus fruit, garden truck, and alfalfa are grown by irrigation. The land is rolling and hardpan is usually found within a few feet of the surface. Efforts were made to organize an irrigation district for Fallbrook at the same time the Escondido district was launched, but the project got no farther than preliminary organization. Water for irrigation is secured by pumping from wells. The underground supply has not been well determined, but indications are that it is not abundant. The country about Fallbrook can be supplied with water from either the Santa Margarita or the San Luis Rey. The proposed Pauma reservoir, if constructed on the latter stream, would be in a position to serve this territory, although it is probable that the water available from the San Luis Rey might be used to better advantage on lands along that stream. Some development may be expected in Santa Margarita Valley from pumping underground waters, as the supply is good. The conditions for underground waters are also good in Temecula Valley, but this is the only one of the mountain valleys that may be expected to develop by irrigation. A reservoir site is located on the Santa Margarita at the junction of Temecula and Murietta creeks. By constructing a dam across the narrow gorge at the upper end of Temecula Canyon water could be stored in a large basin above. The flow of Temecula Creek, however, is small and loss by evaporation would have to be considered. It is not certain that the water supply would justify construction, as the water would have to be carried 10 or 15 miles by a pipe to reach Fallbrook or Santa Margarita Valley. The watershed above Temecula Canyon is 120 square miles, but it contains more rolling than mountainous country. A large portion of the land on the lower stream could be irrigated provided the flood waters were conserved.

Santa Margarita Valley contains 6,272 acres of agricultural land, Fallbrook 12,800 acres, and the mountain valleys 95,000 acres, a total of 114,072 acres. The areas irrigated are as follows: Santa Margarita Valley 1,200 acres, Fallbrook 122 acres, and mountain valleys 310 acres, making a total of 1,632 acres.

SAN LUIS REY, ESCONDIDO, AND SANTA YSABEL VALLEYS AND LINDA VISTA MESA.

Under this heading is included all of that portion of San Diego County lying between Santa Margarita and San Diego rivers. The total area of agricultural land is 154,498 acres, and of this 4,995 acres are irrigated. The San Luis Rey and the Santa Ysabel are the only streams in this territory which rise in the high mountains of the eastern part of the county. Escondido Creek drains a small territory between the two rivers. San Marcos, Los Penasquitos, and other small creeks cross the mesa near the coast, but are not of much consequence as regards water supply. It is convenient to consider all of this portion of San Diego County together because development of the numerous small valleys and coast bench lands depends on the construction of irrigation systems involving the water supply of the several drainage basins.

The only portion that is already well developed is Escondido Valley. This district contains 13,500 acres of agricultural land and is practically on the divide between Escondido Creek and Santa Ysabel River, although the greater portion of the area slopes toward Escondido Creek. The irrigation system here was begun under the Escondido Irrigation District and completed by the Escondido Mutual Water Company, which succeeded the district. The district, which experienced the usual troubles of the early irrigation district organizations, transferred its property to the mutual company on the basis of $225,000 valuation, the actual cost at the time being over $400,000. The district included 13,000 acres and 853 acres are now irrigated under the mutual water companies' system. The principal source of water for Escondido is San Luis Rey River, from which stream 3,000 miner's inches was filed on. The water diverted is carried by open ditch, tunnel, and flume across and through the divide to the headwaters of Escondido Creek. A tunnel is now being constructed to replace 1,900 feet of flume. An important feature of this system is the Escondido dam, a loose rock fill, lined on the upper face with redwood plank and constructed to a height of 76 feet on one branch of the creek, giving a storage capacity of 3,500 acre-feet. The water stored is delivered to members of the mutual company in proportion to stock. The duty of water under the system is 1 miner's inch for 10 acres. The charge is 10 cents per miner's inch for twenty-four hours. Oranges, lemons, grape fruit, raisin, wine and table grapes, vegetables, and alfalfa are irrigated.

The important areas of agricultural land in the San Luis Rey drainage are Warner's ranch, Bear Valley, and San Luis Rey Valley. Warner's ranch is a tract of 44,500 acres occupying a mountain basin 36 miles back from the Pacific coast. The land is rolling and used for grazing. Numerous small streams which drain into the basin from the north, south, and east, where they unite either on the surface or as underground water, form the San Luis Rey River. This drainage is all concentrated at the canyon of the river which gives an outlet to the basin toward the Pacific, and at this point is located the Warner dam site.

Bear Valley is located below Warner's ranch and south of the river at the divide between the San Luis Rey and Escondido Creek drainage. It contains 11,800 acres of agricultural land and 200 acres are irrigated. This area has been very little developed owing to the lack of water and transportation.

San Luis Rey Valley borders the lower river. Two small companies, the San Luis Rey Irrigation Company and the Libby Ditch Company, have ditches from the river covering lands in this valley, and there are in addition a number of pumping plants. The irrigating company is a mutual organization, but the Libby Ditch Company is not incorporated. Water is available for irrigation only in the winter months, although the San Luis Rey is the largest stream in San Diego County. The crops irrigated are alfalfa, sugar beets, and vegetables. Several mountain valleys on the headwaters of San Luis Rey River are small and they have not been classed as agricultural land owing to the poor prospect of development. San Luis Rey Valley contains 25,600 acres of agricultural land and 2,147 acres are irrigated.

The principal areas of agricultural land on Santa Ysabel River are San Dieguito, San Pasqual, Santa Maria, and Green valleys. The Santa Ysabel is sometimes called San Dieguito River, this name being applied especially near the coast. It is also sometimes called the San Pasqual, in its middle course where it traverses San Pasqual Valley, while the upper river is known as Bernardo River.

San Dieguito Valley contains about 2,000 acres, of which 150 acres are irrigated, alfalfa being the principal crop under irrigation.

San Pasqual Valley contains 3,440 acres, of which 1,040 acres of deciduous fruits, alfalfa, and vegetables are irrigated. The soil is a light sandy loam and free from alkali. The holdings vary from 5 to 300 acres each. The irrigation is under the East San Pasqual Ditch Company and the West San Pasqual Water Company. Both are coöperative, but neither has been incorporated. The respective rights of these associations to water from the river have been defined in the case entitled *Huffner* vs. *Judson,* in the Superior Court in 1898. Both companies have been in litigation with riparian owners, but these questions are still unsettled. Water is diverted from the river by ditches, that on the east side irrigating 240 acres and that on the west side about 800 acres. Of the land on the west side 401 acres is entitled to all of the water going to the association during the irrigating season, but the remainder of the land receives water during the winter. A few artesian wells have recently been drilled in this valley.

Santa Maria Valley is located on Santa Maria Creek, the principal tributary of the Santa Ysabel. The valley contains 16,380 acres and 102 acres are irrigated. Lands in the vicinity of Ramona, the settlement in this valley, are held in 5 to 40 acre tracts, and the grain land at the borders in much larger tracts.

Green Valley lies south of the Santa Ysabel and is not adjacent to either the main river or an important tributary. It contains 2,450 acres, none of which is irrigated. The land is rolling and is underlaid with hardpan, as are most of the valleys of this region.

San Marcos Valley is northwest of Escondido. It contains 33,200 acres, of which 213 acres of citrus fruits and vegetables are irrigated. The unirrigated land is in grain. The land is rolling and is underlaid with hardpan of the same nature as that found at Escondido. The underground water is the supply for the irrigation of the small area receiving water.

Poway Valley is 15 miles northeast of La Jolla and is drained to the ocean through Los Penasquitos Canyon. It contains 2,100 acres, of which only about 20 acres of citrus fruit and vegetables are irrigated. The character of the land is similar to the other valleys of this part of San Diego County.

A strip of bench land borders the coast from the northern boundary of the county to the mouth of San Diego River, a length of 50 miles and with a width of not exceeding 3 miles at any point. This strip would be continuous except for the lagoons where the Santa Margarita, San Luis Rey, Escondido, and Santa Ysabel rivers and other smaller streams enter the ocean. These lands slope gently towards the coast and are adapted to agriculture, although the ocean winds might not permit the growing of citrus fruits. The chief settlements along this coast are Oceanside at the mouth of the San Luis Rey, Encinitas at the mouth of Escondido Creek, and La Jolla and Pacific Beach, resorts near San Diego. The total area of the coast land is 24,960 acres, of which 270 acres are now irrigated. Some of the land is within large Spanish grants. The crops irrigated are alfalfa, a few truck gardens and commercial flower gardens in the vicinity of settlements. The unirrigated lands are used for grain and lima beans.

Linda Vista Mesa contains 19,000 acres of good agricultural land and embraces a territory lying just north of Mission Valley on the San Diego River and just back of La Jolla and Pacific Beach on the coast. The mesa corresponds in elevation to La Mesa and Lemon Grove on the south side of San Diego River and is above the coast bench. The area is very broken in outline owing to numerous little canyons that have been eroded by the streams running toward the sea. The soil is suitable for citrus fruits even though it has the characteristic hardpan. The ocean breeze is less violent than at points immediately on the coast. Years ago the Linda Vista Irrigation District was organized for a territory of 4,200 acres embracing the mesa. Bonds were sold to the amount of $178,000. The Pamo, Santa Maria, and Dye Valley reservoir sites, together with the water rights and right of way for conduits, were acquired and preliminary engineering work done. The district failed, leaving the lands under mortgage and liable for interest on the bonds until recently, when the district was dissolved. Consequently no development occurred during this period. Much of the land was not even dry-farmed and remained in its desert state with growth of brush and grass. Much of the soil is loamy and reddish in color, mixed in places with water-worn cobble. Alkali is not present in quantities that would be detrimental to agriculture. There are some small holdings, but a large portion of the land is held in tracts of thousands of acres. This land should be adapted to lemon culture, being situated much the same as Lemon Grove, Chula Vista, and other districts in San Diego County.

The development of the agricultural areas in this part of San Diego County lying between Santa Margarita and San Diego rivers depends much on the action of the Volcan Land and Water Company. The operations of this corporation may be objected to by the Escondido water users who have vested rights in San Luis Rey River. The Escondido company owns land bordering the south side of the San Luis Rey and claims riparian as well as appropriation rights. The Volcan Land and Water Company contemplates the construction of Warner, Pamo, and Santa Maria reservoirs, together with the ditches and pipe lines necessary for connecting them into one system, extensive power development below the reservoirs, and delivery of the water for irrigation of Linda Vista Mesa and several valleys. Claims have been made to all of the unused waters of San Luis Rey and Santa Ysabel rivers above the reservoir sites. Construction of the Warner dam has been begun and rights of way have been secured and surveys are being made for the completion of the project. It is proposed to build Warner dam to a height of 60 feet, although the height can be increased to 100 feet. The reservoir has a watershed of 213 square miles, over which the rainfall is probably 30 inches. The company has estimated that the amount available for storage annually is 125,200 acre-feet. One of the greatest objections to the Warner site is the comparatively flat basin above the dam which will expose a large area of water surface and lead to high loss by evaporation. It is proposed to convey the water stored in the Warner reservoir southwestward across the divide to the projected Pamo reservoir in the valley by that name on Santa Ysabel River. This basin has a watershed of 114 square miles, the greater portion of which is from 1,500 to 5,000 feet in elevation. The amount available for storage annually is estimated by the company's engineer at 41,090 acre-feet. The outlet conduit from the Pamo basin is surveyed to continue southwestward through San Pasqual Valley and toward Linda Vista. The Santa Maria reservoir will be connected to the canal in San Pasqual Valley. This site has a watershed of 56 square miles with elevations of from 1,300 to 4,000 feet. It has been estimated that 8,700 acre-feet are available for storage, making a total of 174,990 acre-feet for storage by this system.

The discharge of San Luis Rey River for the period 1903 to 1910 at Pala is 50,000 acre-feet annually, and that for Santa Ysabel River at the head of San Pasqual Valley for the same period 38,500 acre-feet annually.[1] The Pala gagings on the San Luis Rey are, however, 24 miles below Warner reservoir. Gagings made by the Volcan Land and Water Company in December, 1905, and each month from January to June, inclusive, of 1906, also each month from May to November, inclusive, of 1911, show a mean monthly discharge varying from 1.2 to 765.9 cubic feet per second.

The capacity of the reservoirs of this system in acre-feet are: Warner 173,000, Pamo 44,000, and Santa Maria 12,000. The San Luis Rey and Santa Ysabel are subject to great extremes of flow and the floods of an occasional year may be several times the normal. For this reason the complete utilization of the flood waters depends on sufficient storage capacity to impound the waters of the great floods and hold them for use in dry years. The total storage capacity contemplated is 229,000 acre-feet. The company proposes to divert 85,000 acre-feet annually.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

If the Volcan system furnishes water for 43,000 acres it is probable that most of the land reclaimed will be on Linda Vista Mesa. The irrigation of these lands must come from storage of flood water as underground water is not available on the mesa. Poway Valley has 24 square miles of local watershed. It is estimated that 800 acres may be irrigated from the Volcan system and local sources. The stored water if not used elsewhere can be conveyed to Escondido, San Luis Rey, San Dieguito, Green, San Marcos, and Bear valleys, also the coast bench lands. It is estimated that 3,000 acres in San Luis Rey Valley and 1,000 acres in San Dieguito Valley may be irrigated by the development of underground water alone. Bear and Green valleys have but little local watershed and underground water is not sufficient to give prospects of much development. About 500 acres might be irrigated in San Marcos Valley. It is possible that some underground water in San Pasqual Valley is intercepted by the concrete subsurface dam at the head of the San Pasqual ditches, but some pumping, together with a higher duty of water, should lead to the irrigation of practically all of the valley, 1,200 acres. Santa Maria Valley and Warner's Ranch both furnish reservoir sites and riparian land. Probably 300 acres may be irrigated in Santa Maria Valley. Prospects are not favorable for irrigating more than 40 acres on the coast bench near Oceanside. It is estimated that a total of 51,600 acres may be irrigated in this part of San Diego County, including 11,000 acres for Escondido. Power may be developed between the Escondido dam and distributing system.

SAN DIEGO RIVER VALLEYS AND MESAS.

San Diego River rises in the mountains near Julian and flows southwestward to False Bay, just north of San Diego Bay. Boulder Creek, the outlet of Cuyamaca Lake, is one of the chief tributaries. The districts dependent upon this stream for water are El Cajon Valley, the first basin crossed by the river after leaving the mountainous country; Mission Valley, which includes the narrow strip of bottom land along the river flanked on both sides by mesas just north of San Diego, La Mesa and Lemon Grove, being the mesa south of the river, and Spring Valley, a small area south of El Cajon Valley. Spring Valley lies within the drainage basin of Sweetwater River, but is too high to receive water from that stream. It is possible to bring water from San Diego River through Sweetwater Pass for use on this area.

The following table summarizes the areas of agricultural and irrigated land under San Diego River:

Summary of agricultural and irrigated areas under San Diego River.

Area.	Irrigated land. Acres.	Agricultural land. Acres.
El Cajon Valley	27,100	1,143
Mesa land	12,000	4,700
Mission Valley	3,000	1,000
Spring Valley	2,600	300
Totals	44,700	7,143

The soil of El Cajon Valley is of sandy loam with good drainage. The soils of Spring Valley are similar to those of El Cajon Valley. Mission Valley is low and flat and portions are sometimes flooded during heavy rains. The soil is fertile, but alkali is found in the lower marshy areas. La Mesa and Lemon Grove are elevated areas in which the drainage has eroded deep channels, leaving irregular-shaped areas of mesa extending out from the hills. Hardpan is present on these mesas, but it does not seriously hinder fruit-growing, as the hard stratum is readily broken up by blasting for the planting of young trees. The level portion of the mesa slopes westward at the rate of about 50 feet per mile.

Improved lands are held in tracts of 5 to 40 acres and the unimproved grazing land in tracts of several thousand acres.

El Cajon Valley, La Mesa, and Lemon Grove are supplied with water by the Cuyamaca Water Company, formerly known as the San Diego Flume Company. This system utilizes Cuyamaca Lake as a storage reservoir. An earthern dam was constructed to a height of 41.5 feet, increasing the capacity of the lake to 12,000 acre-feet. The mean annual run-off from the drainage above the basin is about 5,000 acre-feet. Water released from the reservoir follows Boulder Creek to the north fork of the main river, where it is diverted into a flume 36 miles in length. Lateral pipe lines are taken from the flume to supply lands in El Cajon Valley and La Mesa. Water rights under this system were sold at from $600 to $800 per miner's inch, 1 miner's inch serving 10 acres. The company is a public service corporation and charges an annual rental of $60 per miner's inch.

Two distributing reservoirs are located near the lower end of the flume. The upper or Cujomeco reservoir has a capacity of 36 acre-feet and the lower or La Mesa reservoir a capacity of 1,460 acre-feet. This company has one pumping plant in El Cajon Valley and others in Mission Valley which are operated in dry seasons to supplement the supply of water from the flume.

A variety of crops are grown in El Cajon Valley, including oranges, lemons, grape fruit, raisin and wine grapes, olives, berries, deciduous fruits, and vegetables. La Mesa and Lemon Grove are known for their lemon orchards. All the crops are irrigated.

Alfalfa, sugar beets, and vegetables are grown in Mission Valley, water for irrigation being supplied by several small ditches and pumping plants. The Julian apple district is located in the rolling land at the headwaters of the north fork of San Diego River at an elevation of about 4,000 feet. Some other deciduous fruits are also grown here. Orchards at Julian are unirrigated.

Although Cuyamaca reservoir has more than sufficient capacity to store the ordinary run-off, some water can not be stored in years of high rainfall and there is a possibility of the dam being raised to increase the efficiency of the system. The watershed above the reservoir is 11.5 square miles. The annual rainfall over this area varies from 12 to 40 inches and the mean run-off is 5,307 acre-feet. The watershed drains a portion of Cuyamaca Peak, the highest point in San Diego County, reaching 6,516 feet in elevation, but the large area of water surface leads to a large loss by evaporation. The total loss between the amount stored in the reservoir and the amount delivered to users, including both evaporation from the lake and the loss from the flume, is about 50 per cent. The watershed above the intake of the flume is about 100 square miles. The waters of the north fork as well as those from the reservoir are taken by the flume. During flood season much water overtops the diversion dam and runs to waste except that it contributes to the underground reservoirs in El Cajon and Mission valleys. San Diego River is usually dry during fall and early winter. The Lake Helena or Dye Valley dam site is located on the north fork of San Diego River, about 1 mile above the head of the flume. The watershed above it is 80 square miles. A dam could be constructed to give a capacity of 10,000 acre-feet. The measurements of San Diego River near Lakeside for the period 1906 to 1910 show a mean annual discharge of 39,600 acre-feet.[1]

Further development of underground waters in El Cajon and Mission valleys is now taking place and considerable increase in the irrigated area should come from this source. Water is found at depths of 15 to 30 feet over El Cajon Valley. It should be possible to secure enough water from wells in Mission Valley to irrigate all the land there. It is estimated that ultimately over 15,000 acres will be irrigated from San Diego River. This district has been comparatively free from litigation, there having been only a few minor court cases.

SWEETWATER VALLEY AND CHULA VISTA MESA.

Sweetwater River is south of San Diego River and flows into San Diego Bay south of National City. It rises east of Cuyamaca Peak and passes through mountains for 30 miles, after which it reaches more open country. Sweetwater dam is constructed across a gorge where the river passes through San Diego County almost parallel to the coast. The principal valley is known as Sweetwater Valley and is located below the reservoir. The Chula Vista mesa, with its lemon groves, borders

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

San Diego Bay on the south side of the river. A number of small valleys of less importance are located along the river in the mountains, among them being Lawson Valley and the basin about Descanso.

Sweetwater Valley and Chula Vista contain 14,080 acres of tillable land and 4,750 acres are irrigated. All of the water is secured through the Sweetwater system excepting a little pumped from wells. The crops grown include lemons, oranges, grape fruit, olives, alfalfa, grain, and vegetables, all being irrigated excepting grain and in some cases olives. Land holdings are small.

The soils are generally light sandy loams with some river sediment in Sweetwater Valley. In some places the citrus groves extend well up on the hill slopes, water being pumped from wells in Sweetwater Valley for their irrigation. Some heavy soil is found on the Chula Vista mesa or National ranch lands and a hardpan is present which is blasted for the planting of citrus trees.

One acre-foot per acre annually is considered ample for citrus orchards but the amount of water stored in Sweetwater reservoir has not always been sufficient for the delivery of this amount and the actual use has fallen as low as .3 acre-foot per acre.

The irrigation system is owned by the Sweetwater Water Company, formerly known as the San Diego Land and Town Company, which is a corporation supplying water to the land owners. The rate is $7 per acre per annum up to a total of 350,000 gallons. A charge of 2 cents per thousand gallons is made for any amount in excess of this. The distributing system is of iron pipe and the water is measured to land owners through meters of the type used for city domestic systems. The company claims all flood waters of Sweetwater River. The company or its predecessors have been involved in a number of very expensive lawsuits.

Sweetwater reservoir has been enlarged twice since its original construction, the last addition to the dam being completed in 1911, when the height was raised 15 feet. The present capacity is 35,422 acre-feet. The total cost of the system is over one million dollars. The dam is curved and originally was constructed of cement masonry but the last addition consisting of both height and thickness was of concrete. The height now is 113 feet. The watershed above the reservoir is 186 square miles in which the elevations range from 200 to 6,000 feet above sea level. The rainfall at the dam is about 12 inches and the average for the entire shed is estimated at 20 to 21 inches. The average evaporation from Sweetwater reservoir amounts to 4½ feet in depth annually. The mean annual run-off of Sweetwater River for eighteen years is 10,700 acre-feet. The capacity of the reservoir before the last enlargement was 22,500 acre-feet. This capacity was not sufficient to store all of the floods in a year of high rainfall and at times water over-topped the dam. The present capacity is sufficient for impounding the entire run-off of the watershed except possibly in an extremely wet year and the enlargement greatly increases the efficiency of the Sweetwater system. The discharge of the river in only one of 18 years exceeded the present capacity of the reservoir. Some years scarcely any water has been stored in the reservoir but it is safe to have storage capacity for a 3-year supply. During the dry years of 1898 to 1900 twelve pumping plants were installed along Sweetwater River to supplement the supply in the reservoir. The plants have an aggregate capacity of 794 miner's inches. They have not been operated for several years. It is probable that the addition to the dam will result in a slight increase in acreage irrigated but this improvement is regarded as one of security rather than extension of the company's service. Some increase may come from the operation of pumping plants now located along the river and from further development of underground waters. There being no diversions below Sweetwater dam pumping should not lead to trouble and the underground supply appears to be good.

A reservoir site is located on Sweetwater River near Descanso at an elevation of 3,300 feet and 24 miles above the Sweetwater reservoir. A survey of this site shows that a dam 100 feet high would provide storage capacity for 10,000 acre-feet. Since Sweetwater reservoir now has sufficient capacity to store all run-off of the river in an ordinary year it is doubtful if the upper site will be utilized at least for a good many years. The utilization of the upper site might permit power development not possible from the Sweetwater reservoir and it might also result in the prevention of some loss of water that now occurs from the channel above Sweetwater reservoir.

OTAY AND TIA JUANA VALLEYS.

Otay and Tia Juana valleys, together with the adjoining mesas, contain 36,318 acres of agricultural land of which 1,360 acres are irrigated. Practically all of the water furnished by the mountain portions of these streams in the United States is claimed by the Southern California Mountain Water Company for the domestic use of San Diego. Otay Creek is the next stream south of Sweetwater River. The Tia Juana rises in the mountains of Baja California but crosses the international boundary line and empties into the ocean south of San Diego Bay. Cottonwood Creek is the chief American tributary. The main areas of agricultural land bordering the Otay and the Tia Juana are near the coast, where their valleys join and all of the irrigated land is located in this section. The Tia Juana has some valley in Mexico.

A number of small basins in the mountains do not contain much agricultural land. The chief one on Otay Creek is Jamul Valley, while Pine Valley is the most important in the Tia Juana drainage. Pine Creek enters Cottonwood Creek from the north and is one of the main branches of this system as regards water supply.

The soils of these valleys are sandy loams, while reddish sandy and clay loams are found on the mesas. Some of the upper areas have a hardpan at a depth of several feet below the surface, which must be broken up for tree planting, but after it has been broken no serious results have been experienced. Alkali is found only in small areas near the coast. The land bordering the streams is adapted to alfalfa and garden products, while the rolling mesa land is well suited to citrus and other fruit trees. Grain is grown where no water has been provided for irrigation.

Water for irrigation is supplied chiefly by pumping plants located in the valleys and it is used very economically. One miner's inch is sufficient for 10 acres of citrus fruits and for 5 or 6 acres of vegetables. The lands of the Little Landers corporation are located in Tia Juana Valley. Under this project it was intended that each member of the colony have 1 acre to farm aside from a building lot. The total tract comprises 500 acres, about 200 acres of which is already under irrigation. Water is derived from 5 wells about 30 feet deep, in which the water stands at 4 feet below the surface. The pumping lift is about 16 feet. Water is stored in small reservoirs and distributed through pipes. It is the intention for the water system to become the property of a mutual company of the land owners, but in 1910 the promoting company was temporarily, at least, financially unable to proceed with the original plan. The San Ysidro Irrigation District has been organized. It proposes a $75,000 bond issue for securing water from wells in Tia Juana Valley.

The system of the Southern California Mountain Water Company as planned will, when complete, include four storage reservoirs. The Upper and Lower Otay reservoirs were the first constructed. The third impounding basin has been formed by the completion of Moreno dam on the headwaters of Cottonwood Creek. There is a possibility that the fourth basin will be provided by the construction of a dam at the Barrett site just below the junction of Pine and Cottonwood creeks. The capacities of these reservoirs are as follows:

Capacities of reservoirs supplying water to San Diego.

Name.	Gallons.	Acre-feet.
Upper Otay	1,090,000,000	3,300
Lower Otay	13,000,000,000	39,900
Moreno	15,000,000,000	45,800
Totals	29,000,000,000	89,000
Barrett (proposed)	15,000,000,000	45,800

The Upper Otay dam is a curved dam of reinforced concrete 84 feet high on the west branch of Otay Creek and with a watershed of only 12 square miles. The run-off is not sufficient to fill the reservoir except when the rains are very heavy. The Lower Otay reservoir is on the main stream below the junction of Jamul and Dulzura creeks. It has a watershed of 100 square miles including that of the Upper Otay. The dam is 130 feet high and is a loose rock fill with a core of riveted steel plate protected on either side by a wall of concrete about 1 foot in thickness. The outlet is at the 48-foot contour, making only the upper 82 feet effective. The natural drainage is insufficient to fill the reservoir, but provision has been made for bringing water from Cottonwood Creek by the construction of the Dulzura conduit through the pass by that name, and the excess capacity of the Lower Otay may be used to store water that can not be held in reservoirs on the Cottonwood. The Dulzura conduit is 13.38 miles long and diverts water from Cottonwood Creek at the Barrett dam site. After crossing the divide between the Cottonwood and Otay watersheds it discharges into Dulzura Creek, whose course the water follows en route to Lower Otay reservoir. The conduit has 9,219 feet of tunnel and 4,490 feet of flume, the remainder being open ditch lined with concrete. Moreno dam is constructed in a rocky gorge of the high mountains and is a rock-fill with an upper face of cement masonry covered with concrete slabs to make it water-tight. Underneath the superstructure is a concrete foundation reaching to bedrock. The height of the dam is 365 feet over all and 150 feet above the stream channel. Five and a half feet can be conveniently added with considerable increase in capacity. This dam is in volume one of the largest constructed and cost $750,000. The reservoir has a drainage area of 135 square miles. The Barrett site consists of a narrow gorge where it is possible to build a high dam without great length. Any water that cannot be stored in the Moreno reservoir can be passed on to a reservoir at Barrett site, and both are above the Dulzura conduit which connects the Cottonwood system with Otay Creek. The Barrett site has a watershed of 115 square miles, exclusive of that above Moreno dam. The mean annual discharge of Cottonwood Creek near Jamul, from 1905 to 1910, was 31,000 acre-feet.[1] Still another reservoir site, located in Pine Valley, has been reported, but there is no assurance that this will be utilized.

This system has been constructed primarily for serving the city of San Diego with a domestic supply and although construction has been a little in advance of the needs of the city contracts for the delivery of water for irrigation have not been made as it is anticipated that the city will soon acquire the system as a municipal plant. If all of the water were now conserved there would be more than is now needed for domestic use, but as the city is growing rapidly it is probable that the time will come when the entire supply will be required. There is a drop of 700 feet between the lower end of the Dulzura conduit and the Lower Otay basin which offers some possibilities for power development.

The Southern California Mountain Water Company acquired the rights of a number of companies, among them the Mount Tacate Land and Water Company, the Otay Water Company, and the Jamacha Irrigation District, which failed to materialize. Some increase in the irrigated land on the lower part of the two rivers should come from pumping, but this can not be great as the underground water will probably be diminished by storage in the mountains.

---

Summary for San Diego County.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
Santa Margarita River valleys and Fallbrook	114,072	1,632	10,000	Storage on Temecula Creek and underground waters.
San Luis Rey, Escondido, and Santa Ysabel valleys and Linda Vista	154,498	4,995	51,600	Storage on San Luis Rey, Escondido, and Santa Ysabel rivers and underground waters.
San Diego River valleys and mesas	44,700	7,143	15,000	Storage on San Diego River and tributaries and underground waters.
Sweetwater Valley and Chula Vista Mesa	14,080	4,750	7,500	Underground waters.
Otay and Tia Juana valleys	36,318	1,360	3,000	Storage on Cottonwood Creek and underground waters.
Totals	363,668	19,880	87,100	

COLORADO DESERT AND RIVER VALLEYS.

The country east of San Gorgonio Pass has conditions that differ in many respects from those within the coastal drainage of southern California, yet in other respects there are some characteristics in common. Agricultural development once begun on the desert has been as rapid as that near the coast. This section, on account of its long hot summers, is not the first choice of most home builders for residence, although it enjoys proximity to beach and mountains not found in many of the interior irrigated sections of the West, and it has grown rapidly in spite of disadvantages for residence.

The rainfall is of no value in supplying moisture to crops or as a water supply. Colorado River is the source of water for all irrigated districts excepting Coachella Valley. This stream depends principally on the snows in the mountain states. The incentive for economy in the use of water is not so great as it is near the coast.

Practically all of the land on the desert originally belonged to the Government. Consequently, land holdings are large compared to those on the west side of the range where settlement was by purchase of private lands. Ranching predominates, although many of the fruits grow as well as on the coast. This division has peculiar problems in the control of Colorado River and the rights to use water from an interstate and international and navigable stream, some not being within the jurisdiction of the State. The organizations for the distribution of water have not all taken their final form, but it is evident that they will eventually be managed by the water users themselves.

COACHELLA VALLEY AND DESERT.

Coachella Valley and the desert is a northwestern extension of Colorado Desert and the valley is a portion of the Salton basin and is largely below sea level. The upper portion of the desert is also a continuation of San Gorgonio Pass. Both the valley and desert are within Riverside County. The greater portion of Coachella Desert is not considered as an agricultural country as the winds which sweep through San Gorgonio Pass and toward the lower heated area are so severe that tender vegetation can not withstand the drifting sand carried. The desert is crossed by rocky washes leading from the mountain canyons and is dotted with mammoth hummocks and covered with a sparse growth of greasewood and cactus in its upper areas. All brush leans towards the southeast, showing the prevailing trend of the air currents. Exceptions may be made regarding small pockets of land lying at the mouth of Palm Canyon on the southwest side and below Mission Creek Canyon at the northwestern end of the desert. About 10,000 acres near Palm Springs and about 6,300 acres below Mission Canyon may be considered as agricultural land. Morongo Valley is situated in the San Bernardino Mountains, a few miles north of the upper end of the desert, at an elevation of 2,300 feet above sea level. It is a mountain basin crossed by Big and Little Morongo creeks, both of which drain southward to Coachella Desert. It lies in San Bernardino County and contains 8,300 acres of agricultural land in addition to the number of acres given for Palm Springs and Mission Creek. Coachella Valley includes 142,600 acres of agricultural land, making a total of 167,200 acres for both desert and valley, including Morongo Pass. These sections are considered together because they have in large measure a common water supply.

Whitewater River is the principal stream and drains the eastern slope of Mount San Gorgonio with an elevation of 11,485 feet. The river enters the desert at the northwestern end and its wash may be traced practically all the way to Salton Sea. The Whitewater runs throughout the entire year. East of the Whitewater is Mission Creek, big and Little Morongo creeks, and other streams of less importance. These may be considered tributaries of the Whitewater as the water discharged from their canyons is absorbed by the gravels on the desert and must eventually mingle with those of the larger stream before reaching Coachella Valley. The water from the main river itself seldom runs on the surface for more than a few miles after leaving the canyon.

The lands of the desert are made up of the alluvium from the mountain streams which enter from all sides. Palm Canyon and Tahquitz Creek drain the San Jacinto Mountains, but the eastern slope is so precipitous that the drainage is much less than that from the San Bernardino Mountains. The fall from San Jacinto Peak, with an elevation of 10,805 feet, to Palm Springs, is over 9,000 feet in 7 miles.

The soils of Coachella Valley vary from the coarse sands of the alluvium of local streams in the upper areas to tight adobe originating as Colorado River sediment in the lower areas near Salton Sea. Alkali has been brought to the surface in the low areas by the underground water. Lands bordering Salton Sea contain salts in excess of 3 per cent.[1]

All of the land originally belonged to the Government, but the Southern Pacific Railroad Company, through its grant, acquired half of the sections in most of the valley and desert. For years the railroad lands were not on the market and settlement begun on the Government land under the desert and homestead acts, but within the last few years much of the railroad land has been sold. Farms range in size from 40 to 160 acres. Portions of the valley are reserved for the Indians.

According to the irrigation census taken in 1909, 3,791 acres were irrigated in Coachella Valley that year. There has been a slight increase since 1909. The irrigated land is scattered about Indio, Coachella, Thermal, and Mecca and some is on the Indian reservations. About 50 acres are irrigated near Palm Springs with water from Palm Canyon and Whitewater River. The figures are not available on the acreage irrigated in Morongo Valley, but it is probable that a small area of land is receiving water as the result of late development by wells.

The water for Coachella Valley is the underground supply which percolates southeastward from Whitewater Canyon toward the Salton basin. It is estimated that nearly 500 wells have been drilled in the valley. About 150 are pumped, and most of the others are artesian. The first wells were 400 or 500 feet in depth. The artesian area extends through the center of the valley above the Salton basin and at one time it reached beyond Indio covering an area of 140 square miles. The draft on the underground water was heavy and during the ten years ending in 1905 a shrinkage of one third in the area occurred, with the result that some of the wells in the upper portion of the valley near Indio which originally flowed had to be pumped. The artesian area is all below sea level, but this has no real significance, as it is impossible that underground water comes from the sea, since wells near the Salton basin produce saline water, while the wells in Coachella Valley deliver water with a high degree of purity.[2] Following heavy rains in 1905 the underground water partially recovered its former level and the discharge of many wells was restored to the former yield. Within the last few years some wells from 1,000 to 1,400 feet deep have been drilled and these produce a heavy artesian flow. They penetrate a lower water-bearing stratum in which the pressure is stronger. The gasoline engine is the most common power for pumping plants.

The crops of Coachella Valley include cantaloupes, grapes, Bermuda onions, cotton, citrus fruits, alfalfa, grain, and dates. All crops are watered as this is a section where nothing can be grown without irrigation. The climate resembles that of Yuma and Imperial Valley and the maximum daily summer temperatures range from 90° to 120° Fahrenheit. The summer season is seven or eight months in duration and the growing season extends almost throughout the entire year. Measurements of the amount of water used on different crops are not available.

[2] U. S. Geol. Survey, Water Supply Paper No. 225.

but it is probable that alfalfa requires about 4 acre-feet per acre and most other crops no more than half that much. Where flowing wells are depended on for irrigation it is customary to store the small discharge of wells in earthen reservoirs in order that a larger irrigating head may be used from the supply thus accumulated.

The Rodgers ditch diverts water from Whitewater River and carries it to Palm Springs, where it is sometimes sold to the Indians for use on the reservation. The ditch has a capacity of 350 miner's inches.

It is difficult to estimate the amount of water entering the gravels of Coachella Desert from the mountain watersheds. The rainfall in the valley, as shown by records at Palm Springs and Indio, is approximately 3 inches annually and it is probable that the evaporation is sufficient to offset all precipitation over the desert itself. Only the higher mountain watersheds can be considered as contributing much to the underground water supply. The Whitewater has a mountain watershed of 60 square miles, Mission Creek 35 square miles, and Palm Canyon 180 square miles. The rainfall varies from 3 inches to 20 inches within these watersheds. As there is little timber or brush on the eastern exposures the run-off is rapid, but on the other hand the evaporation in this hot, dry climate is excessive. It is not probable that more than one tenth of the agricultural land in Coachella Valley will ever be irrigated from its own watershed and underground water.

The water users of Coachella Valley have brought suit to restrain the Consolidated Reservoir and Power Company from diverting water from Whitewater Canyon to be used for the development of electric power and irrigation in San Gorgonio Pass.

IMPERIAL VALLEY.

Imperial Valley is the reclaimed portion of the Colorado Desert. The region was uninhabitable before irrigation began in 1900. Development since has been very rapid.

Imperial County was formed from San Diego County in 1907, it then having the required population of 10,000. The county now supports five incorporated cities of 1,000 to 2,000 population, viz., El Centro, the county seat, Imperial, Brawley, Calexico, and Holtville; also several other growing settlements.

The Salton Basin was once part of the Gulf of California and the land of the valley was formed as delta of Colorado River. Nearly all of the irrigated section is below sea level, the bottom of Salton Sea being more than 280 feet below sea level.

The soil is silt several hundred feet deep and varying in hardness in different parts of the valley and at different depths, but the texture remains fine whether the consistency is that of adobe or of the loose soil. The soils at the edges of the basin are slightly coarser, due to the intermingling of sand from the mountain washes. In general, the central portion of the valley contains more hard soil than the surrounding portion. The hard soil, while containing a greater degree of fertility than the loose soil, is more difficult to pulverize by cultivation and must be worked at just the right time after applying moisture. The difficulty in irrigating the soil is to get moisture to sufficient depth that it may be retained and not lost by evaporation in the hot and drying atmosphere. The loose soil takes water much more freely and retains it for a greater length of time, consequently it is not necessary to irrigate so frequently as with hard soil. The desert soils are rich in salts and minerals, but deficient in humus and nitrogen. Alkali is present in proportions that are damaging to plant life in limited areas only. Some of these areas, such as that near Mesquite Lake between Brawley and Imperial, have been in part reclaimed by washing the land. The problem with alkali is one of the proper handling of water in irrigating. If water is used in excess, a local ground-water table will be formed, the rise of which will bring the salts to the surface. If the irrigation is carefully done and only enough water applied to furnish the required amount of moisture for plant growth, trouble need not be expected. Where the alkali content is high and water is applied in furrows, it is necessary to keep the salts well distributed by an occasional flooding for the growing of such crops as asparagus. The land slopes from 2 to 15 feet per mile, depending on location.

This region is known for the long, hot summers. The climate and soil are conducive to luxuriant plant life where the necessary amount of moisture is supplied. The maximum daily temperatures of summer range from 90 to 126 degrees Fahrenheit. It seldom falls below freezing in winter, although temperatures of about 20 degrees are recorded. The relative humidity is low during most of the hot season. The rainfall is not of value in supplying moisture to crops. Records for the valley cover a comparatively short period only, but a 31-year record at Indio in Coachella Valley, where conditions are about the same, shows an annual precipitation of 2.70 inches. The prevailing winds are from the southwest. They become dust storms at times preceding the hot weather, but are refreshing in summer.

A great variety of crops can be grown. The California Experiment Station is experimenting to determine the best standard crops. It has been demonstrated by land owners that the following are adapted to the soil and climate: Alfalfa, barley, Kafir and Egyptian corn, cotton, sugar beets, cantaloupes, watermelons, Bermuda onions, tomatoes, cabbage, sweet potatoes, chili pepper, blackberries, grapes, apricots, figs, olives, and dates. Some of the foregoing are limited to certain parts of the valley and to certain kinds of soils. The medium and soft soils have a greater range of suitable crops than the hard soils. Some of the crops, including alfalfa, are adapted to all of the classes of soils, although alfalfa thrives best in the softer grades.

Frost excludes citrus fruits from the selection of crops for the lowest areas. Vegetables, such as tomatoes, have been successfully grown in winter. Crops that have been grown with varying results in different cases and regarding which conclusions can not yet be drawn are: Potatoes, wheat, Indian corn, peaches, pears, plums, and strawberries. Apples and cherries are not suited to the hot desert climate.

The chief industries include the growing of alfalfa, grain, cotton, melons, grapes, and asparagus; also cattle, sheep, and hogs. Dairying is also followed with great success. Alfalfa constitutes a large portion of the feed for live stock, the greater number of the fields being pastured and not cut for hay. Alfalfa produces seven and eight crops per year.

Underground water in amount for extensive irrigation is not found in Imperial Valley. Borings at Imperial and El Centro reached depths of 800 to 1,500 feet without striking water. Wells bored to a depth of 800 to 1,400 feet at Holtville and north of Holtville flow. The water produced has a temperature of about 102 degrees. The surface of the ground in this locality is near sea level. The water probably percolates from Colorado River. The flow of wells is light and sufficient only for the irrigation of tracts of a few acres and for domestic use. An artesian flow was secured at Brawley from a well 1,880 feet deep.

Imperial Valley is irrigated from Colorado River by a canal constructed by the California Development Company. When the canal is clean, it has a capacity of over 3,000 second feet. The water is directed from the river just above the international boundary line. On account of the topography of the country, the canal detours into Mexico before entering Imperial Valley. It was necessary to organize a separate company, La Sociedad de Irrigacion y Terrenos de la Baja California, under the laws of Mexico, to operate the portion of the system in that country, but the stock of the Mexican company was owned by the California Development Company. The main canal is 56 miles long. It then divides near Sharpes, just south of the international boundary, into three branches, one each for the eastern, central, and western portions of the valley. The headgate near Colorado River is a concrete structure. Originally the drops, gates, and other structures along the main canal and its branches were of wood, but these are gradually being replaced by concrete structures of the best type.

The lands of Imperial Valley all belonged to the Government except the alternate sections of railroad land adjacent to the Southern Pacific track at the northern end. Some land was taken by settlers under the Homestead Act, but the major portion was filed on under the Desert Act; consequently there are many holdings of 320 acres each and families sometimes control one or two sections. Up to the present time there has not been much subdivision and the average size of farms is over 160 acres. The California-Mexican Land and Cattle Company own several thousand acres near Calexico, also nearly a million acres south of the international boundary, all operated as one ranch from American headquarters.

The California Development Company delivers water at fixed rates to mutual companies that were organized by the settlers of the various districts laid out according to topographical features of the valley. The Development Company constructed the distributing systems and transferred them to the mutual companies in exchange for their capital stock. The Development Company then sold the stock of the mutual companies to the settlers. The price of the stock steadily advanced with the demand from $5.75 to $25.00 per acre. The cost of constructing the distributing systems was much less, so that the Development Company profited by this transaction aside from any profit from the sale of water.

Contracts were also made with the mutual companies for the delivery of water at the rate of 50 cents per acre-foot, the amount to be delivered not to exceed 4 acre-feet per acre annually. The water charge was in turn paid by the user to the mutual company of which he was a member. The Development Company stands a loss by seepage and evaporation of 10 per cent of the amount delivered. Any loss in excess of this amount must be stood by the mutual companies. In addition to the water charge, mutual company members must pay the cost of maintenance and operation of their distributing system and the stock is assessed at the rate of about $1.25 per year for this purpose. The delivery of water is the main expense of operation and the cleaning of canals is the chief item in maintenance. The waters of the Colorado are heavily laden with silt and the quantity entering the ditches of the mutual companies exceeds 1 per cent by volume after settling thirty days, as shown by extended measurements of this office. This represents the quantity of mud that must be removed each year. Various types of dredges are operated to keep the channels open and crews of brush cutters are kept at work clearing the banks of weeds and the channels of aquatic growth.

Water is delivered to the user on order, within reasonable limitations. The duty of water, under Imperial Water Company No. 1, is 1.75 acre-feet per acre. Nearly one half of the land in this district is in alfalfa. The duty in the other mutual company districts is a little lower, but the No. 1 district being the oldest, shows more correctly the amount of water that will be used in the future. Alfalfa requires about 3 acre-feet when producing seven to eight crops. All other crops require no more than half as much. Water is measured to users as the basis of computing the charges.

Imperial Water Company No. 5 has an excellent drainage system in connection with its irrigation system. Provision has not been made in the other districts for drainage. Conditions for natural drainage from the land are improved by the erosion of the deep channels of New and Alamo rivers by the Colorado floods of 1905 and 1906.

Colorado River is an interstate and international stream and a division of the water between the two nations is subject to treaty. The river is classed as navigable by the Government and matters of navigation are controlled by the War Department. Questions arising from the use of water for irrigation in the several states embraced in its drainage would be referred to the Federal courts. Questions relating to the use of water within California are under the jurisdiction of the State courts. As yet troubles have not arisen between appropriators within the State. The California Development Company filed on 10,000 miner's inches from the river in the manner prescribed by the State. The company also secured concessions from Mexico for the taking of water from the river in that country, and it is under obligation to deliver one half of the total amount diverted for use on Mexican lands, provided the land owners offer the rate charged in the United States. Mexican landowners have not taken full advantage of this opportunity. Some land south of the international boundary is irrigated from the main canal, but it is in American ownership. The right to water for use in Imperial Valley is based on use, whether the right be vested in the user or the public service company. The first use in the valley antedates the diversions for other valleys on the lower river, except that of the old private ditches at Yuma and Palo Verde.

Litigation in Imperial Valley has related principally to various contracts between the development and mutual companies, to stock ownership, and to the legality of the development company's charging what is equivalent to a bonus, while at the same time charging for water. It has been demonstrated under the receivership of the development company that the water charge is sufficient to pay a good profit without other sources of revenue. The rate has not been fixed by the County Supervisors or by the State Railroad Commission. In *Thayer* vs. *California Development Company* it was decided that the company must deliver water to persons having access to its canal and offering the usual charge when demanded for use on land within the district originally intended to be supplied, provided the water was available and the company was already equipped for such delivery.[1]

Electrical power is developed at Holtville, at the plant of the Holton Power Company, with water from the canal system. The water is turned into Alamo River and most of it is used or will be used for irrigation by the North End and other mutual water companies that have filed on the waste waters.

The California Development Company is at present heavily in debt and under the management of a receiver. The Mexican company is also in the hands of a depositario or Mexican receiver. The events which led up to the company's insolvency are matters of history and relate largely to the expense of controlling Colorado River. The largest creditor is the Southern Pacific Company, which advanced money for turning the river to its original channel to prevent inundation of Imperial Valley and its own property by the rise of Salton Sea. The Southern Pacific Company took as security for loans the control of the Development Company. The Imperial Valley Irrigation District has been organized under the State law to include 511,000 acres and all of the land now irrigated, and this organization is now bargaining with the Southern Pacific Company with the view to acquiring the main canal system, the presumption being that the railroad company will buy the system at receiver's sale to protect its own claim, after which it will be in position to dispose of the property to the water users. It is the plan of the irrigation district to take the place of the California Development Company and deliver water to the mutual companies as they now stand; also to other lands within the district and outside of the territory covered by the mutual companies.

---

[1] Since this was written the Supreme Court of California reversed the decision of the lower court and decided that the California Development Company is not a public utility.

Meanwhile irrigation under the present system is being extended by the construction of a canal to skirt the east side mesa. In view of the experience already gained, a duty of 1 cubic foot per second for 182 acres is being taken as the basis in designing this extension. The following table shows the extent of irrigation at present under the system of the California Development Company:

Summary of irrigated areas under California Development Company, 1912.

Name of company.	Area irrigated. Acres.
Imperial Water Company No. 1	99,600
Imperial Water Company No. 4	18,000
Imperial Water Company No. 5	45,000
Imperial Water Company No. 6	15,000
Imperial Water Company No. 7	16,000
Imperial Water Company No. 8	24,000
Imperial Water Company No. 12	11,000
Total	228,600

The Imperial South Side Water Company was recently formed from the district of Imperial Water Company No. 1, and is adding 13,000 acres to the area irrigated. This, together with a new allotment of stock now permitted in Imperial Water Company No. 1 on the basis of four instead of five shares to 5 acres, makes it possible to irrigate nearly all of the 135,000 acres that were originally in the No. 1 district. The Imperial South Side Water Company, also the Imperial East Side Water Company, and the South Alamo Water Company, are now purchasing water directly from the depositario of the Mexican company. The East Side and Alamo companies serve small areas. The North End Water Company filed on the waste waters of Alamo River and diverts them for use on lands near Salton Sea. The district embraces 10,000 acres and 6,360 acres are irrigated. The Imperial North Side Water Company has been organized for an additional area to receive water through the canal of the North End Water Company. The Bernice Water Company has a district of 30,000 acres to be irrigated north of District No. 5. Approximately 260,000 acres are now irrigated in the valley, the area being the largest under a canal in the United States. The new East Side canal, together with the projected Bernice dam, will add 131,000 acres to the irrigated area. An attempt is being made to place water on about 5,000 acres above the West Side canal and north of Signal Mountain, but it may be difficult to maintain a ditch for this section, owing to shifting sand dunes. About 400,000 acres will eventually be irrigated in the valley. With appropriations from the river from Yuma and Palo Verde, together with an increasing demand for water in Mexico, it is doubtful if water for a greater acreage could be safely depended on unless the discharge of the river is regulated by storage reservoirs in the mountains. The river has a drainage area of 225,000 square miles. The mean annual discharge at Yuma for the period 1902 to 1910 was 16,300,000 acre-feet.[1] The governing factor is the discharge in the several seasons with reference to the use of water at the same time. The maximum use of water is in August and, fortunately, it nearly coincides with the flood season for the river. The river is lowest in January and February. The annual flood comes in May, June, and July, and almost without variation the highest water occurs in the latter part of June. The discharge of the river varies from extremes of 3,500 to 150,000 second feet.

The valley contains 510,000 acres of irrigable land. About 129,000 acres on the east side mesa and 177,000 above the canal on the west side are classed as irrigable, making a total of 816,000 acres, of which only 400,000 are certain to be irrigated. Soils on both the mesa and the west side are slightly coarser than those of the basin. Water could be pumped for the irrigation of some of the land above the canals, providing the supply in the river is sufficient. The western territory includes the valleys of San Felipe and Cariso creeks. It is possible that a limited area west of Salton Sea and north of Superstition Mountain may be irrigated from wells, as this section gives promise of some underground water.

YUMA INDIAN RESERVATION.

The Yuma Indian Reservation embraces that part of Yuma Valley in California. It is opposite the town of Yuma, on the Colorado River, and reaches from Pot Holes to El Rio, being in Imperial County. The altitude at Yuma is about 100 feet. The Indian Reservation is included in the lands to be watered from the Yuma Government Project. Construction is done by the Reclamation Service of the Interior Department, in accordance with the reclamation act. The irrigation system is being paid for by and will become the property of the land owners who have formed the Yuma Valley Water Users Association.

Conditions at Yuma are best described by comparison with those at Imperial, there being much similarity in soil and climate. The soils of the reservation are sand and silt loams and adobe. They contain more sand and are a little coarser in texture than Imperial Valley soils. In general they are probably less fertile, but are easier to keep in a mulched condition by cultivation. The soils originated as Colorado River sediment. Limited areas on the reservation contain from 1 per cent to 3 cent of alkali, but the greater part of the land has less than .2 per cent.[2]

The temperatures in both summer and winter are generally 2 or 3 degrees lower than in Imperial Valley. The humidity is about the same except for the latter part of summer, when it is slightly greater at Yuma owing to the winds which blow northward along the river channel from the Gulf of California during this season. The prevailing winds are from the west and southwest. Dust storms are frequent in the spring.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

[2] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Yuma Area, Arizona.

The normal annual rainfall is not over 3 inches and the evaporation from a water surface amounts to about 7 feet in one year.

The eastern half of the reservation was open to entry when water for irrigation was available from Laguna Dam. The farm unit is 40 acres. Several sloughs traverse the valley near the river and portions of the land were formerly overflowed when the river was in flood. Levees have now been constructed as a part of the irrigation project to protect the lands from overflow. The moist areas support a rank growth of brush, which is expensive to clear, but the productiveness of the land under irrigation justifies the cost.

The western portion of the reservation is still held for the Indians, there being about 700 families, each with a 10-acre allotment. The area irrigated in 1912 is 6,500 acres.

All crops are irrigated. Alfalfa is the principal crop, although both southern and Egyptian cotton, melons, vegetables, berries, etc., are grown with success. Apricots, figs, and olives may be produced and live stock and dairying will no doubt be developed. Frosts are too severe on the river bottom lands for citrus fruits. They are grown on the Yuma mesa in Arizona, which is 60 or 70 feet higher than the valley. Alfalfa is flooded by the border method and vegetables are irrigated by furrows. The duty of water under the Yuma Project is five and one half acre-feet per acre per year. Alfalfa produces seven crops.

Water rights on Colorado River have not been adjudicated. Several small private ditches on the Arizona side received water intermittently prior to the construction of the large canals on the lower Colorado. They received water only at high river stage and irrigation under them was irregular. It is the intention of the water users in the several valleys on the lower Colorado to oppose contemplated diversions in other States near the river's headwaters.

The Yuma Project was designed for the irrigation of about 111,500 acres, of which 75 per cent was private land. Of the total, 16,500 acres are in California and 95,000 acres are in Arizona. Of the land in Arizona, 15,000 acres are in Gila Valley above Yuma; 50,000 acres are in the Colorado River Valley below Yuma, and 30,000 acres are on Yuma mesa and must be supplied by pumping from the canal under a total head of about 80 feet. The project was 73 per cent complete in June, 1912. Laguna Dam is a diversion weir across the river, 15 miles above Yuma. It raises the level of the river 10 feet and is 4,780 feet long. It is a loose rock fill between parallel walls of concrete, and has a covering of concrete. The dam was not intended to form a storage reservoir and the small basin above the dam rapidly filled with silt, except in the river channel. A canal is taken from the dam on the Arizona side for the lands in Gila Valley. A larger canal leads from the dam to Yuma on the California side, and laterals from this canal supply the Indian reservation with water. The main canal crosses under Colorado River at Yuma by a concrete inverted siphon and covers the valley land in Arizona below Yuma by gravity. Laguna Dam cost about $2,000,000, and, together with the levees for the protection of the valley on both sides of the river, accounts for the high acre cost of the project. The cost of water rights, when paid for in ten equal annual installments as originally provided for under the reclamation act, has been fixed at $55 per acre. So many of the settlers were unable to make the second annual payment that a sliding scale of payment was permitted, but the total cost under this was raised to $66 per acre. The annual payments are: First, $5.50; second, $1; third, $2; fourth, $3.50; fifth, $5; sixth, $7; seventh, $9; eighth, $10; ninth, $11; and tenth, $12 per acre.

In addition to the regular payments, a charge of $10 per acre was made for the lands on the Indian reservation, to be paid at the rate of $1 per acre per year. The annual charge for maintenance and operation has been fixed at $1 per acre and it will be adjusted from time to time in accordance with the needs for funds.

The town of Bard originated with settlement of the reservation. Underground water is abundant for domestic use and can be secured from wells not over 30 feet in depth.

PALO VERDE VALLEY.

Palo Verde Valley is situated on Colorado River and is chiefly in Riverside County, but the southern end reaches into Imperial County. It is 275 feet below sea level. The valley is limited on the west by the abrupt change in level to the mesa. Soils and climate are much like those of Yuma and Imperial Valley, the resemblance being a little closer to Yuma. The soil is Colorado River silt mixed with sand. The combination is one of fertility and good porosity. The long hot summers stimulate the growth of plants and a great variety of crops thrive when supplied with moisture. The annual rainfall is less than 3 inches and of no value to crops. Alfalfa, grain, and cotton are now the principal crops of this newly irrigated section.

The principal towns are Blythe and Palo Verde, but settlements have been started at Neighbors and Rannels. This region is not yet reached by railroad. Blythe is reached by stage from Glamis on the Southern Pacific, distant 60 miles, and from the Santa Fé near Parker, 36 miles away.

The irrigation system was begun for the Blythe ranch when it was in individual ownership. This property of 40,000 acres was later acquired by the Palo Verde Land and Water Company, which continued the construction of the canal system. The company proposes to extend the system for the reclamation of 60,000 acres of land in addition to the Blythe lands. The organization of the Palo Verde Mutual Company was caused and the existing ditches and water rights of the land and water company were exchanged for 60 per cent of the mutual company's stock. The mutual company must complete the irrigation system for the entire 100,000 acres. The mutual company stock is issued to purchasers of Blythe ranch lands or is sold to settlers on the other lands, by the land company. Shares have a par value of $10, there being one share per acre. The stock is assessed for maintenance and operation at the rate of $2 per acre per year. The number of shares issued is 2,500. A share represents the right to the one hundred thousandth part of the water in the canal and the stock is appurtenant to the land. Water has not been measured and the duty of water under the system is not known.

Water rights are based on riparian land as well as appropriation and use, inasmuch as the 40,000-acre tract has a 17-mile frontage on the river. Farms average about 80 acres.

The headgate of the Palo Verde canal was constructed in a rock cut at Black Point. The river at the intake is unusually wide and the fluctuation in the water level is about 7 feet. The canal is on a grade of .02 per cent and has a capacity of 35 second feet. The canal first leads to Olive Lake, 5 acres in area, which is utilized for a settling basin. The distributing system branches out below the lake. The system was capable of irrigating 20,000 acres in 1909. Extensions have been made since and will continue to be made as the lands are settled. Some of the lowlands subject to overflow from the river are protected by a levee. Questions arose recently regarding the character of some of the overflowed land. Claims were made that it should be State property, but the Government decided it was only subject to periodic overflow and was Government land open to entry. The lands in question embraced about 90,000 acres, much of which had been filed upon.

Underground water is abundant at depths of 10 to 20 feet. The water is excellent for domestic use and pumping for irrigation is possible.

The area irrigated in 1912 is 9,000 acres. The valley contains 85,000 acres of irrigable land, all of which will be irrigated.

CHUCKAWALLA VALLEY AND PALO VERDE MESA.

Palo Verde Mesa consists of two benches, the first rising about 40 feet above the valley and the second 10 or 15 feet above the first. Chuckawalla Valley is farther inland and is connected to the mesa through a gap between the mountains. The two sections have much resemblance in their conditions. The soils are little more sandy and less loamy than the land of Palo Verde Valley. The soil is adapted to the culture of fruits, as it takes water very freely, has natural drainage, is fertile, and can be kept in the good mechanical condition required for orchards.

Chuckawalla Valley is almost surrounded by mountain ranges and is well protected. Springs flow at several points at the rim of this basin and water is procured for domestic use from dug wells 30 feet in depth in places and may be secured at less than 200 feet in any part of the basin. A well was bored to a depth of 1,029 feet in the hope of securing artesian water. The water rose near to the surface, but did not flow. Boring to a greater depth would possibly give artesian water.

Water may be had in abundance from wells on Palo Verde Mesa about 130 feet in depth.

Chuckawalla Valley is from 300 to 500 feet in elevation. Some dry lake beds or areas with poor drainage are found in the low part of the basin.

The best lands are above on the slopes. The land of both valley and mesa is free from alkali in harmful quantities and is covered with a growth of greasewood, sage brush, and cactus. Certain areas of Chuckawalla Valley support ironwood trees.

The first proposal to irrigate Chuckawalla Valley and Palo Verde Mesa was by the Chuckawalla Development Company. Extended surveys were made for bringing water from Colorado River. It was proposed to construct a storage reservoir at Bulls Head, 12 miles above Fort Mojave, by placing a dam across the river channel. Electrical power was to be developed by water from this reservoir and transmitted to pumping stations on a canal to take water from the river 20 miles above Ehrenberg, Arizona, the pumping being necessary to elevate the water to the mesa and Chuckawalla Valley. The project was for 200,000 or more acres of land in valley and on mesa. The project has been abandoned on account of the difficulty of securing a suitable foundation for a dam at Bulls Head and the cost of the work.

All of the land belonged to the Government and on the strength of the preliminary work of the development company nearly 300,000 acres of land was soon filed upon. The entrymen have now formed an association for the purpose of making their own investigations with a view to procuring water for irrigation. They propose to form an irrigation district and issue bonds to the amount of $6,500,000 for the construction of a canal system for 220,000 acres. The canal is to be filled by pumping from Colorado River, near Ehrenburg.

The irrigation district plan is not so well adapted to the reclamation of a desert as to the acquisition of a system which has been already financed, for the reason that the desert land has so little taxable value before water is applied. The disposal of the bonds may be a difficult matter.

Chuckawalla Valley has 246,000 acres and Palo Verde Mesa 106,000 acres of agricultural land. With pumping from wells on the mesa 250,000 acres or a greater area may eventually be reclaimed, provided no trouble is experienced in securing right to water from the river.

OTHER COLORADO RIVER LANDS.

Three other areas bordering Colorado River seem worthy of consideration as agricultural lands. The first above Palo Verde Valley is the tract bordering the river at Calzona in Riverside and San Bernardino counties. It has an area of 18,425 acres. The soil is similar to that of Palo Verde Mesa, but the slope to the land is not so even as that on the Palo Verde Mesa. The climate is much like that of Palo Verde. Many desert filings have been made in the past and some have been abandoned. Underground water is not counted on for irrigation. The promoters of Calzona are preparing to pump water from Colorado River for the town and for irrigation of 6,000 acres. Calzona is on the Parker line of the Santa Fé Railroad and is a trading point for mines in the surrounding mountains and for the Colorado River Indian Reservation.

The next area going northward is Chemehuevis Valley. It is on Colorado River in San Bernardino County, about midway between Needles and Parker, and contains 5,060 acres. No development has taken place. The soil is river silt, but prospects for irrigation in the near future are not encouraging, as the nearest railroad is 25 miles distant. Little is known of the underground waters, but it is probable that the supply would be good on this tract adjacent to Colorado River.

A strip of valley and mesa land borders the Colorado northward from Needles and is a part of Mojave Valley, of which the greater portion is in Arizona. The valley also extends below Needles, but this is not classed as agricultural, as it is subject to overflow by the river. Valley lands near Needles are also endangered in the flood season, and in recent years the river has been cutting toward the west. More levees are needed for protection from floods. This area contains 89,065 acres, of which a few small tracts are irrigated and producing alfalfa. Some of the land is broken and washed and its classification is doubtful.

The valley supports willow and other brush. Underground water is plentiful at a depth of 20 feet.

Summary for Colorado Desert.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
Coachella Valley and desert	167,200	4,000	10,000	Underground waters.
Imperial Valley	816,000	260,000	400,000	Colorado River, San Felipe and Carisco creeks.
Yuma Indian Reservation	18,000	6,500	16,500	Colorado River.
Palo Verde Valley	85,000	9,000	85,000	Colorado River.
Chuckawalla Valley and Palo Verde Mesa	352,000	----------	250,000	Colorado River and underground waters.
Other Colorado River valleys	112,550	100	5,000	Underground waters of Colorado River.
Totals	1,550,750	279,600	766,500	

MOJAVE DESERT.

Mojave Desert, unlike Colorado Desert, can not depend upon a large river for water for irrigation. Although the largest of the divisions, it has been the least exploited and developed and it has the least prospect of becoming a highly productive country. Aside from a small portion adjacent to Mojave River, lands on this desert must be reclaimed principally by development of underground waters. It is impossible to even approximately estimate the amount of such waters available, as the usual methods of determination are very unreliable in a country with so little rain and such rapid evaporation of moisture from the heated sands.

The proper classification of the lands is difficult and at best is only a rough approximation. Where it is certain that water is available, the alkalinity of land is in some cases undetermined. It has been impossible to examine all of the areas personally within the time allotted for the investigation and it has been necessary to rely upon information from other sources.

The idea that this desert is one vast plain of heated sand and alkali flats, without water either above or below the surface, is erroneous. Although a territory of great extent, it is broken by hills, buttes, and mountains of no mean elevation and is dotted by innumerable depressions or so-called dry lakes, where surface waters accumulate and sink after showers and in which springs burst forth to make oases. Only the more important areas are included.

Development on the desert has recently been stimulated by the discovery that underground waters could be secured at reasonable depths in many of the sinks, and by the demonstration of the fact that apples and other deciduous fruits could be produced in the Southwest at elevations of 2,000 to 4,000 feet of a quality to compete successfully with those of northern states.

MOJAVE RIVER VALLEY AND ADJACENT MESAS.

This area includes the valley and desert sink of Mojave River, together with the mesa lands on both the east and west, at the northern base of San Bernardino and San Gabriel mountains. The valley of Mojave River should not be confused with Mojave Valley on Colorado River, near Fort Mojave. The bench immediately east of the valley opposite Hesperia is known as Apple Valley, although in reality it is a mesa. Farther to the east is the Box Springs country. The elevation of the entire strip of mesa on both east and west sides of the river is about 3,000 feet. Frosts are too severe for citrus fruits, but apples, pears, cherries, apricots, alfalfa, and vegetables are grown. The mesa lands have a uniform slope and are well suited to irrigation. The desert in its native state is covered with a growth of giant yucca, greasewood, or creosote bush and other brush. The expense of clearing land is not high.

Mojave River lands are adapted to alfalfa. The normal discharge of the stream is absorbed below the canyon, but the water is brought to the surface above Victorville Narrows. The water appears and disappears alternately along the river course, but the surface flow gradually diminishes until completely lost at Cronese Sink on the desert.

The areas of agricultural land are Mojave River Valley 195,000 acres; Mojave River Sink 40,000 acres; East Mesa 130,000 acres; West Mesa 545,000 acres. The area irrigated has not been very definitely determined, as the irrigated lands are scattered and a complete canvass could not be made, but it probable exceeds 10,000 acres.

The Hesperia Land and Water Company was originally organized for the sale of 3,000 acres and the irrigation of 30,000 acres of land. About 2,000 acres were sold. Water was sold to purchasers at fixed rates. The water was diverted from Mojave River and conveyed in pipes. The Hesperia Company has been succeeded by the Appleton Land, Water, and Power Company, which proposes to store water in the mountains for power development and for the extension of irrigation near Hesperia and the projected town of Appleton. A new main conduit consisting of 30-inch steel pipe is being laid. The operations of this company are being objected to by the Arrowhead Reservoir and Power Company and ranchers with lands riparian to the river.

A number of small ditches take water from the river for alfalfa irrigation from Hesperia to Cottonwood. Drafts are also made on the subterranean flow at various points. Works were constructed in the river bed near Daggett about 15 years ago for the collection of underground water by a subsurface flume.

The Mojave River Land and Water Company proposes to irrigate 20,000 acres by pumping along the lower river. Surveys have been made for the delivery of water to each 160 acres. Wells are being drilled and pumping plants installed at a rapid rate throughout the entire valley and adjoining mesa, the greatest activity being shown in the lower valley near Barstow, Daggett, and Otis, and in Apple Valley southeast of Victorville. Good wells are secured near Kramer and Hinckley west of Barstow. Wells several hundred feet deep near Barstow are reported to produce 150 miner's inches. Water can be had at shallow depths along the river near Daggett and Otis. A number of flowing wells are located just above the Victorville Narrows. The water stands at less than 10 feet from the surface in other wells and they produce 150 miner's inches on being pumped. Apple Valley has a good supply of underground water. Excellent wells are secured by boring about 500 feet in depth. The water must be lifted from 100 to 200 feet, depending on location. The borings show no rock and plenty of water bearing sand and gravel. A well at the Box Springs ranch gives a light flow and water may be had at less than 100 feet in other sections of the Box Springs country.

In general underground water is not so abundant on the west mesa. Water is reached at 30 to 200 feet, the depth being greatest toward the mountains on the south. Both dug and drilled wells have been made in this section. Ditches are being constructed to drain Cronese Lake in order that the lands of the basin may be farmed. Lands throughout the valley and mesa are being acquired under the Desert and Homestead acts with the expectation of growing alfalfa and deciduous fruits. The rainfall is about 8 inches. One miner's inch of water is sufficient for 2 or 3 acres of alfalfa and 5 to 10 acres of orchard, depending on the method of application.

The most important single work affecting this region is the project of the Arrowhead Reservoir and Power Company in San Bernardino Mountains. The Arrowhead dam is nearly completed and is located on Little Bear Creek, a tributary of Mojave River. The dam is of the hydraulic-fill type with concrete core wall and is one of the largest of its kind ever constructed. The drainage of several other tributaries besides Little Bear Creek is diverted into the reservoir through tunnels. The total drainage basin is 86 square miles. The capacity of the reservoir is 61,000 acre-feet. The company, after making measurements of rainfall and run-off at many points in the watershed and of loss by evaporation for a period of sixteen years, expects to deliver 40 second feet continuously from the reservoir. The water will be used first for power, and afterwards for irrigation. It is not known what lands will receive the water, but it will probably be used along Mojave River. The entire mountain watershed of Mojave River is 470,000 square miles. The summer discharge at Victorville is usually over 30 second feet. The mean annual discharge of the river from 1899 to 1905 was 69,400 acre-feet. A reservoir site is located above Victorville Narrows, but the depth to bedrock in the gorge has not been determined.

ANTELOPE VALLEY.

Antelope Valley is the southwestern part of Mojave Desert and is an undulating plain at an elevation of from 2,300 to 4,000 feet above sea level. It lies immediately north of the San Gabriel Mountains of the Sierra Madre Range and east of Tehachapi. Its northern and eastern limits are not so well defined but for the purpose of this report the division line between Antelope Valley and Mojave Desert is taken as the San Bernardino County line. It is possible that the line between the drainage of the two areas if known would include a small portion lying in San Bernardino County, but the major portion of the valley lies in the northeastern corner of Los Angeles County and the southeastern corner of Kern County. The valley is covered with a desert growth of sage, creosote, yucca, and other desert brush; also salt grass in some of the low areas. It has a maximum length of 60 miles and a width of from 20 to 3 miles. It contains 485,500 acres of agricultural land and of this amount 4,629 are irrigated. The land has a gradual fall from west to northeast at a rate of about 15 feet per mile until the eastern portion is reached. Here the surface is almost level. The plain is broken by Antelope, Rosemont, Lovejoy, and Black Buttes. The lower portion of the valley about Rosemont, Buckhorn, and Rodgers dry lake beds is an artesian area 240 square miles in extent.[1] Some salt is found in the lower areas but it is principally white alkali and it is believed that all of the land can be reclaimed. Land owners claim that two years of cultivation overcomes the damaging effect of the salts to such an extent that ordinary crops can be grown. This section is visited by winds and hummocks are formed about the desert brush in the central portion of the valley. Bench lands border the base of Tehachapi Mountains and the San Gabriels as far east as Palmdale. The benches are not visited by such heavy frosts as the lower areas and they are better suited to fruit growing. The lake beds sometimes contain water to a few inches in depth after storms and it is not certain that the lands occupied by them can be utilized for agriculture. The Rosemond and Turner dry basins have not been included in the area of agricultural land. Much of the land bordering the Southern Pacific tract is yet railroad land. Aside from the La Liebre ranch and Palmdale Colony tract the land holdings are from 40 to 640 acres. Small farms are increasing in number. Some Government land remains open to entry in the outlying areas.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 278.

The chief crops grown are alfalfa, grain, almonds, pears, and apples, while alfalfa, pears, and apples are irrigated. The elevation is too great for citrus fruits. The irrigated almonds along the base of the San Gabriel Mountains west of Lancaster produce fairly well, although many orchards in this locality have been abandoned. Alfalfa produces five crops and averages from one to one and one half tons per acre for each cutting. The Little Rock Irrigation District supplies water by a ditch from Little Rock Creek to about 700 acres. About 300 acres of alfalfa is grown along Big Rock Creek. It is estimated that 1 miner's inch of water is sufficient for 5 acres of orchard where the water is piped. Under pumping plants it is stated that 1 miner's inch of water is required per acre for the first two years in irrigating new land after which time two thirds miner's inch per acre is sufficient. All of the pumping plants in this valley have been installed within the last three years. The limits of underground water have not been determined. The depth to water increases away from the artesian area. Water must be lifted from 40 to 70 feet near Neenach, 24 miles west of Lancaster. The lift near Palmdale is about 70 feet. New wells are continually being drilled where it is anticipated that the pumping lift will not be over 50 feet. About 105 pumping plants have been installed. Many artesian wells are grouped about Lancaster and Esperanza and others are scattered throughout the artesian area, the total number of flowing wells being 300.

The surface flow of Big Rock Creek has been used by irrigators for some 20 years and rights are based on this long-continued use. The flow of Little Rock Creek was formerly divided between the Little Rock Irrigation District and the Palmdale Colony Company, but the latter allowed their rights to lapse through disuse and the district now claims all of the natural flow of the creek. A reservoir site with capacity of 50,000 acre-feet is reported as being located on Rock Creek where its flood waters might be stored. Another site with capacity of 12,000 acre-feet is located immediately south of Palmdale and this basin was formerly used to store water from Little Rock Creek. It was intended to irrigate 10,000 acres about Palmdale from this supply. Meagre information is had regarding other reservoir sites located on Cottonwood and La Liebre creeks. It is proposed to develop water on these streams for use on the La Liebre ranch of 10,000 acres. The Little Rock Irrigation District is extending its acreage and ultimately expects to have 3,500 acres under its ditch. It is proposed to revive the old Antelope Valley Water Company which in the nineties organized the Palmdale Colony and to irrigate 3,500 acres of land from the Palmdale reservoir.

It is difficult to estimate the available water for Antelope Valley The rainfall varies from minimum of 3 inches on the desert to a maxi mum of 24 inches in the mountains. The watershed is 620 square miles. Numerous small streams which reach the plains from the mountain slopes are absorbed in the sands. Assuming a rainfall of 12 inches over the 260 square miles and 20 per cent of this as the amount reaching the underground basins, 33,280 acre-feet would be added annually. The ultimate irrigated area is estimated at 40,000 acres.

DESERT BASINS IN SAN BERNARDINO COUNTY.

Mesquite Valley borders the Nevada State line in the extreme northeastern corner of San Bernardino County. It contains 30,000 acres of Government land, none of which is irrigated. It is a desert basin with no surface outlet and is at an elevation of 2,500 feet. Both alkali and hardpan are reported to be present in localities. Springs are located in Kingston or Nopah Mountains, but little is known regarding underground waters, and this would be the only source of supply for irrigation. Mesquite Valley is 25 miles distant from the Tonapah and Tidewater Railway.

Ivanpah Valley is on the Salt Lake, Los Angeles and San Pedro Railroad in San Bernardino County near the Nevada line. It is at the foot of the Providence and New York ranges and drains to a dry lake bed within the area. It contains 223,000 acres, none of which is irrigated. The land has a good slope for irrigation and supports cactus and desert brush. It is all above the 2,900 foot elevation. Springs and creeks discharge from 1 to 3 miner's inches throughout the summer at the rim of the basin. Underground water is secured at a depth of 75 feet in the low area and at not over 200 feet on higher lands. Some wells are being drilled and pumping plants installed for the irrigation of small tracts. Plans are announced for the construction of a tunnel in Providence Mountains in the hope of developing 100 miner's inches of water.

Barnwell Sink is 25 miles northwest of Needles in San Bernardino County at an elevation of 3,000 to 4,000 feet. It contains 154,000 acres, of which none is irrigated. The land slopes well for irrigation and is not damaged by alkali. In late years filings were made and some were abandoned. Attempts were made to dry-farm lands, which resulted in failure. Later water was reached at 40 feet in a well 220 feet deep, and several hundred acres were seeded to grain and alfalfa to be irrigated. The idea prevails that underground water conditions are fairly good in the western part of the basin. The watershed includes drainage from the New York and Piute Mountains on the north and east. Piute and Vontrigger Springs are among the best on the desert and are drawn upon by the railroad. Barnwell Sink is on a branch of the Santa Fe Railway.

A desert sink is located southwest of Needles in San Bernardino County, and another is in Riverside County touching the San Bernardino County line. Both are 10 to 15 miles from Colorado River and neither is reached by rail. Each contains 115,000 acres. The soil ranges from shifting sand to sandy loam and the land belongs to the

Government. Dry farming was tried and failed in the northern sink. Little is known of underground waters, but they are reported at depths of 200 to 500 feet. The basins are 800 feet above Colorado River and underground water must be relied on if land is irrigated.

DESERT BASINS IN KERN COUNTY.

Desert Springs Valley is between Mojave and Randsburg on the Nevada and California Railroad. It is in the southeastern corner of Kern County and east of the Los Angeles aqueduct. It is a basin that slopes northward to Dry Salt Lake at the rate of about 30 feet per mile. It is just north of Antelope Valley and has an elevation of 2,000 to 2,900 feet above sea level. Some of the land was filed on about two years ago and a few small pumping plants are irrigating tracts of 5 to 10 acres of alfalfa each.

The total area is 119,000 acres and about 200 acres are irrigated. Small canyons enter the basin from the mountains on the southwest. Water is secured at from 100 to 200 feet toward Dry Salt Lake; but near Mojave it is at greater depths and in limited amount. Alkali is found near the lake and hardpan underlies the land at varying depths.

Indian or Salt Wells Valley is on the Nevada and California Railroad and east of the Los Angeles aqueduct in the northeast corner of Kern County. It is a basin in which surface water accumulates in so-called dry lakes. The area is 112,000 acres. About 500 acres of alfalfa is irrigated by settlers who filed on Government land in 1910. Injurious salts are found in the eastern portion and hardpan is present at depths of several feet. This area has a fairly good watershed on the west. Underground water is secured at 150 to 200 feet, while water in limited amount is secured in some places at 30 to 40 feet.

DESERT BASINS IN INYO COUNTY.

Rose Valley is on the Nevada and California Railroad and borders the Los Angeles aqueduct between Haiwee Reservoir and Little Lake. It is 15 miles south of Owens Lake and in Inyo County. The land drains to Little Lake. The elevation is 3,000 to 3,700 feet. The basin has some characteristics of both a mountain valley and Mojave Desert land. Settlers who have made desert filings are scattered over the area and have small pumping plants. The basin contains 21,000 acres, of which 100 or more acres of alfalfa are irrigated. Underground water is secured at depths of 150 feet.

Twelve Mile or Chicago Valley is east of the Tonopah and Tidewater Railroad and between the Funeral and Kingston ranges in Inyo County. It contains 8,100 acres, of which 60 acres of alfalfa, grapes, and vegetables are irrigated with water from Resting Springs. The drainage is into a dry lake bed. Nearly all of the land remains in title of the Government. The elevation is over 2,200 feet. Underground water in quantities for domestic use can be had at depths from 100 to 200 feet. The extent of the waters has not been determined sufficiently to justify a statement regarding extensive irrigation development.

Pahrump Valley and its extension, Stewart Valley, contain 20,400 acres in Inyo County, none of which is irrigated. A much larger area is in Nevada, but the best land is in California. This area is 10 miles east of the Tonopah and Tidewater Railroad and Amargosa River. The elevation is from 2,400 to 2,600 feet. The land belongs to the Government. The drainage is to a dry lake. Springs are located in the basin, but data are not available on underground water.

Amargosa Desert is principally in Nevada, but the part in Inyo County, California, contains 15,000 acres. No irrigation development has taken place. The area considered as agricultural land is all north of Scranton on the Tonopah and Tidewater Railroad. The desert is higher than Amargosa Valley and has an elevation of 2,400 feet. The land slopes to the east at the rate of about 50 feet per mile. The desert is at the base of the Funeral Range. Little is known of the possibility of securing water for irrigation. Amargosa Valley is in Nevada and California. The portion in California is not classed as agricultural. Amargosa River rises in Nevada and sinks in California, its waters finally reaching Death Valley. Information regarding Death Valley is meager. This land has not been classed as agricultural.

Summary for Mojave Desert.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.	Possible sources of water for further development.
Mojave River Valley and mesas	910,000	10,000	50,000	Storage on Little Bear Creek and Mojave River and underground waters.
Antelope Valley	485,500	4,629	40,000	Storage in mountain canyons and underground waters.
Desert basins in San Bernardino County	637,000	----------	8,000	Underground waters.
Desert basins in Kern County	231,000	700	10,000	Underground waters.
Desert basins in Inyo County	64,500	160	5,000	Underground waters.
Totals	2,328,000	15,489	113,000	

SUMMARY FOR SOUTHERN CALIFORNIA.

The foregoing report deals with the irrigation resources of southern California in so much detail that it was thought best to outline general conditions in the introduction at the beginning of the report, and also in the briefer introductions and in the summaries concerning each of the divisions into which this portion of the State was segregated for purposes of this study. The following summary gathers together the areas of agricultural land, the areas irrigated, and the areas it is estimated will ultimately be irrigated:

Summary of agricultural, irrigated, and estimated irrigable lands of southern California.

Area.	Agricultural land. Acres.	Irrigated land. Acres.	Estimated area that will ultimately be irrigated. Acres.
Santa Barbara and Ventura counties	509,250	49,656	322,500
Los Angeles and San Gabriel River lands	441,986	167,454	381,500
Santa Ana River lands	876,671	213,407	279,000
San Diego County	363,668	19,880	87,100
Colorado Desert and River valleys	1,550,750	279,600	766,500
Mojave Desert	2,328,000	15,489	113,000
Totals	6,070,325	745,486	1,949,600

WATER RESOURCES INVESTIGATIONS IN CALIFORNIA.

The measurement of the flow of streams in California was begun by the California State engineer in 1878, in accordance with the law requiring him "to investigate the problems of the irrigation of the plains, the condition and capacity of the great drainage lines of the State, and the improvement of the navigation of rivers." The work was restricted to a few localities in the Sacramento and San Joaquin River basins, the principal station being on the Sacramento at Collinsville.

The State Engineer's office was discontinued in 1884, and practically no further stream studies were made until 1894, when engineers of the United States Geological Survey were sent into California and made a few measurements of streams in the semi-arid parts of the State. The following year the Geological Survey established a station on the Sacramento River at Red Bluff and since that time has gradually extended the work as additional funds were available.

The early stream gaging work of the United States Geological Survey was primarily to obtain data in the interest of irrigation. Gaging stations were established in the foothill regions on the more important tributaries of the Sacramento and San Joaquin rivers, and in the southern part of the State. Several reservoir sites, principally in the Sacramento drainage, were surveyed as it was early realized that the low water flow would be insufficient for irrigation purposes.

The appropriations by Congress for water resources investigations were so limited that, unaided, the Geological Survey was unable to carry on as extensive investigations as were necessary in California. Realizing that the development of the State largely depended upon the utilization of its vast water resources, the legislature has from time to time made appropriations for coöperation with the Geological Survey, through the State Engineer, in these investigations. These funds were sufficient to maintain gaging stations on the more important streams available for irrigation.

The reclamation of large areas of arid and semi-arid lands in the State has greatly accelerated the development of California. Cheap power must be available if the remarkable growth of the State is to be maintained. Although but a small per cent of the possible water power has been developed, California now ranks as the second State in the Union in the total water power development.

Stream flow measurements for water power development must be on the headwaters and tributaries far above the foothill stations maintained for irrigation. As a rule the desired stations are at isolated points and difficult to reach. On this account the investigations are expensive to maintain. Through the coöperation of the United States Forest Service valuable water power records are being obtained, which would be practically impossible to secure in any other way. Considerable stream gaging work is being carried on by private parties and corporations throughout the State. Many of these coöperate with the Geological Survey or furnish their records for publication. It is realized that legitimate developments will be assisted in this manner.

The Conservation Commission, in making its inventory of the natural resources of the State, at once realized that additional stream flow data were imperative and hence in August, 1911, entered into the following agreement with the Geological Survey:

WHEREAS the United States Geological Survey is authorized by Congress to gage the streams and determine the water supply of the United States and to prepare reports on the best methods of utilizing the water resources, and in pursuance of that work has organized and equipped a corps of engineers, the members of which have become specially trained in the technical necessities of such investigations, and is maintaining an office at San Francisco, California, for the purpose of facilitating such investigations in that State; and

WHEREAS the Conservation Commission of the State of California is authorized to make an investigation of the natural resources of said State, and for this purpose requires:

First, a complete digest of all available data concerning the flow of the streams in the State of California;

Second, records of streams not hitherto investigated;

Third, surveys of the streams showing slope, topography, and such other data as may be necessary to determine water-power and storage possibilities along said streams; and

WHEREAS the Conservation Commission requires the information aforesaid at an earlier date than the same can be furnished by the Geological Survey with its present appropriation for this purpose, or by the Conservation Commission through independent effort and without the organization and equipment of the Geological Survey; and

WHEREAS the Geological Survey and the Conservation Commission believe that the most economical, expeditious, and satisfactory results may be secured by coöperation in such investigations;

Therefore, the following agreement:

This Agreement, made and entered into this seventh day of August, 1911, by and between the United States Geological Survey, the first party, and the Conservation Commission of the State of California, the second party, *Witnesseth*:

First—That the first party shall recommend to the second party such trained men as may be needed to prosecute the investigations aforesaid, such men to be additional to those employed in the regular work of the first party;

Second—That the first party shall advise with the second party in regard to investigations which the latter desires to maintain, and to direct the course of, and supervise the same in accordance with the methods used by the first party in similar investigations;

Third—That the first party shall furnish such instruments, supplies, equipment, forms, and stationery as may be needed in the work; provided, that it is understood that this shall not include the purchase of any special equipment not usually required in the investigations of the first party;

Fourth—That the first party shall furnish to the second party at such intervals as may be requested by the latter reports of investigations in progress, and in addition thereto shall furnish on October 1, 1912, a complete report containing all data collected as a result of this agreement together with similar data already in possession of the first party;

Fifth—That the first party shall publish without cost to the second party in the regular Survey publications the results of all data collected under this agreement as soon as possible after the completion of the investigations hereunder provided;

Sixth—That the second party shall designate to the first party the nature and location of the investigations and studies which it may desire to have made and shall specify the sum of money which it desires to expend for each line of investigation;

Seventh—That the second party shall pay the salaries and expenses of all men appointed by it for the prosecution of investigations included in this agreement;

Eighth—That the second party shall pay for all special equipment necessary for the carrying on of the investigations aforesaid.

In order to carry out the second provision of this agreement the Conservation Commission made an initial appropriation of $12,500. The new work was immediately begun by the Geological Survey and about 75 stations were installed on the headwaters and tributaries of the principal rivers of the State available for power and irrigation developments. Many of these stations were installed on streams which had not hitherto been investigated. The engineers, working under the directions of the Geological Survey, are employed, and their salary and necessary traveling expenses paid, directly by the State. The original appropriation was sufficient to maintain this new work for one year. In order that these investigations may be maintained at their present status until the State is able to make increased appropriations for this work, the Conservation Commission later alloted $10,000 additional. This amount, in addition to the regular funds, will insure the continuance of the present work until July 1, 1913.

The State of California now has available stream flow records adapted to all uses, including domestic water supply, irrigation, power, drainage, flood prevention, and navigation, at 289 points scattered through every portion of the State. The length of the records vary from a few months to several years. It is impossible to tell just how long it is necessary to maintain a gaging station in order that the absolute maximum and minimum, as well as the normal flow, may be determined. To be reliable, the record must extend over several years at least; and of course the longer the record, the more valuable it becomes.

The State Board of Control (Water Powers), now the State Water Commission, appropriated $4,000 to assist the Geological Survey in carrying out the first provision and $7,500 for the Survey as provided for in the third provision of the coöperative agreement. The State Engineering Department also furnished $2,500 for a survey of the San Joaquin River.

Maps of the following rivers have been prepared, showing the fall and the adjacent topography:

Pit River.
Middle Feather River, mouth to Nelson Point.
American River and tributaries.
Tuolumne River, Lagrange dam to Hetch Hetchy Valley.
San Joaquin River.

As provided in the coöperative agreement, the Geological Survey has made "a complete digest of all available data concerning the flow of the streams in the State of California," and at an expense of about $16,000 for printing, has published the following Water-Supply Papers:

295. Gazetteer of surface waters of California, Part I, Sacramento River basin.
296. Gazetteer of surface waters of California, Part II, San Joaquin River basin.
297. Gazetteer of surface waters of California, Part III, Great Basin and Pacific coast streams.
298. Water Resources of California, Part I, Stream measurements in Sacramento River basin.
299. Water Resources of California, Part II, Stream measurements in San Joaquin River basin.
300. Water Resources of California, Part III, Stream measurements in Great Basin and Pacific coast river basins.

The gazetteers, papers 295-297, cover the entire State and embrace descriptions of all the streams named on the best available maps. Each stream is described as rising near the point at which its beginning is shown on the map, and the elevation at that point is given as the elevation of the source. It is, of course, recognized that this method does not give results of great precision, but it probably causes no greater errors in the determination of length and fall than would be caused by extending each stream to the head of the divide between its basin and that of the adjoining streams. It should be understood, however, that all statements of elevation, length, and fall are merely approximate. A complete list of the gaging stations maintained in each basin is included in these papers.

The stream measurement reports, papers 298–300, describe the streams that have been measured and the stations at which the work has been carried on, and presents the results of the studies of stream flow. The investigations of the quantity of water in the streams have been supplemented by studies of the climatic and other factors affecting stream flow, and a mass of valuable information has thus been collected affording data for all phases of hydraulic work. These reports contain all the stream flow data that have ever been collected by the Geological Survey in California to June 30, 1912. Many private records are also included in these papers.

Previous reports of the Geological Survey relating to the water resources of California have been published, as follows:

IRRIGATION.

17. Irrigation near Bakersfield, California. Grunsky.
18. Irrigation near Fresno, California. Grunsky.
19. Irrigation near Merced, California. Grunsky.
45. Water storage on Cache Creek, California. Chandler.
46. Reconnaissance of Kern and Yuba rivers, California. Olmsted and Mason.
68. Water storage in the Truckee basin, California-Nevada. Taylor.
86. Storage reservoirs on Stony Creek, California. Cole.
89. Water resources of the Salinas Valley, California. Hamlin.
219. Ground waters and irrigation enterprises in the foothill belt, Southern California. Mendenhall.

SURFACE WATERS.

17. Irrigation near Bakersfield, California. Grunsky.
18. Irrigation near Fresno, California. Grunsky.
19. Irrigation near Merced, California. Grunsky.
45. Water storage on Cache Creek, California. Chandler.
46. Reconnaissance of Kern and Yuba rivers, California. Olmsted and Mason.
58. Storage of water on Kings River, California. Lippincott.
59. Developments and application of water near San Bernardino, Colton, and Riverside, California. Part I. Lippincott.
60. Developments and application of water near San Bernardino, Colton, and Riverside, California. Part II. Lippincott.
68. Water storage in the Truckee basin, California-Nevada. Taylor.
81. California Hydrography. Lippincott.
86. Storage reservoirs on Stony Creek, California. Cole.
89. Water resources of the Salinas Valley, California. Hamlin.
116. Water problems of Santa Barbara, California. Lippincott.
147. Destructive floods in the United States in 1904. Murphy.
162. Destructive floods in the United States in 1905. Murphy.
237. The quality of the surface waters of California. Van Winkle and Eaton.

UNDERGROUND WATERS.

57. Preliminary list of deep borings in the United States. Part I (Alabama-Montana). Darton.
58. Storage of water on Kings River, California. Lippincott.
59. Developments and application of water near San Bernardino, Colton, and Riverside, California. Part I. Lippincott.
60. Developments and applications of water near San Bernardino, Colton, and Riverside, California. Part II. Lippincott.
89. Water resources of the Salinas Valley, California. Hamlin.
112. Underflow tests in the drainage basin of the Los Angeles River. Hamlin.
137. Development of underground waters in the eastern Coastal Plain region of southern California. Mendenhall.
138. Development of underground waters in the central Coastal Plain region of southern California. Mendenhall.
139. Development of underground waters in the western Coastal Plain region of southern California. Mendenhall.
142. The hydrology of San Bernardino Valley, California. Mendenhall.
149. Preliminary list of deep borings in the United States (Second edition, with additions). Darton.

181. Geology and water resources of Owens Valley, California. Lee.
219. Ground waters and irrigation enterprises in the foothill belt, southern California. Mendenhall.
222. Preliminary report on the ground waters of San Joaquin Valley, California. Mendenhall.
224. Some desert watering places in southeastern California and southwestern Nevada. Mendenhall.
225. Ground waters of the Indio region, California, with a sketch of the Colorado Desert. Mendenhall.
278. Water resources of Antelope Valley, California. Johnson.
294. Ground water resources of a portion of Owens Valley, California. Lee.

These papers are distributed free to persons interested in these data. A few of the early papers are now out of print but may be consulted at the principal libraries and at the offices of the Geological Survey at San Francisco and Los Angeles. Copies of the later publications may be secured through the local offices or from The Director, U. S. Geological Survey, Washington, D. C.

VALUE OF WATER RESOURCES INVESTIGATIONS TO THE STATE OF CALIFORNIA.

Among the purposes for which the results of the investigations of the water resources of California are requisite are domestic water supply, irrigation, water power (including mining), flood prevention, drainage, and navigation.

Domestic Water Supply.—The highest use of water is that of domestic water supply. This use of water has so broad a significance with respect to the general welfare that every citizen of our State is ultimately and intimately concerned. Our large cities are now spending large sums in surveys and construction to insure a more abundant and satisfactory water supply for municipal purposes. The time is not far distant when our smaller towns, which have as yet given little attention to this matter, will be forced to provide more satisfactory water systems if their rapid development is to continue.

Irrigation.—Many millions of dollars have been expended on irrigation systems within the State. Not all of this money was spent wisely, due largely to the fact that stream flow records were incomplete or almost wholly lacking. The integrity of any irrigation system is based absolutely on the amount of water available. Irrigation is largely responsible for the almost unprecedented development that has taken place in California. The cheapest and easiest developments have already been constructed. To greatly extend the irrigated areas it will be necessary to augment the natural low water flow of our streams. This may be accomplished by conserving the flood flow of our rivers and releasing the water as needed, during the irrigation season. In order that the reservoirs may be properly designed it is absolutely necessary to have reliable run-off records for the drainage area.

Water Power.—The development of the water power of the State is an economic necessity. Cheap power must be available for our factories, and for municipal and agricultural purposes. But few of our streams are now furnishing the needed power—not one is developed to its capacity. As in irrigation, only the more accessible and cheap projects have been constructed. The early developments were, of necessity, built near the points where the power was to be used. With the improved machinery and transmission systems now in use, power plants may be built at isolated points. Storage must also be provided during the low water season for large developments. Inasmuch as the amount of water power that may be made available is dependent on the flow of the rivers, the investigation of flow becomes a prerequisite in the judicious development of this source of energy.

Flood Prevention.—The annual damage from floods in California is very great. It is now recognized that to control our rivers during the rainy season it will be necessary to construct large storage reservoirs in the mountains and foothills. The water thus conserved will not only insure relief from disastrous floods but will be available for irrigation and power purposes during the period of low water flow. It is evident that any comprehensive study of flood prevention must be based on a thorough knowledge of stream flow, both in the contributing areas which furnish the water and along the great lowland rivers.

Drainage.—The study of run-off is the first consideration in connection with drainage projects. If by the drainage of a large area in any particular channel that channel becomes so gorged with water that overflow conditions are created in places not previously subject to inundation, then drainage results merely in an exchange of land values. This is not the purpose of drainage improvements.

Navigation.—It is obvious that the determination of stream flow is necessary to the intelligent solution of the many problems herein involved.

Water is without doubt the most abundant and most valuable mineral in the State. Unlike the gold of the Sierra or the oil of the south, the supply may remain undiminished from year to year if the principles of conservation are applied. Extensive areas of irrigable land await reclamation; powerful streams are yet to be harnessed to operate our railroads, mines, and factories, light and heat our homes, and serve us in many ways not at this time anticipated.

In order to interest capital in the development of the water resources of the State we must have definite and convincing data regarding the flow of all of the streams within our borders. Irrigation bonds, which at the present time are not an attractive investment, will be readily negotiable when reliable stream-flow records establish the success of the project.

To insure the continuance of the present prosperity of California and provide for the tremendous developments that are inevitable if wisely assisted, the State must adequately provide for the continuance of these investigations.

Subterranean Storage of Flood Water by Artificial Methods in San Bernardino Valley, California.

By CHARLES H. LEE.

The great value of the ground water resources of Southern California has been so fully demonstrated by their development and use during the last thirty years that there has grown up an urgent public demand for knowledge regarding them. The existence of ground water, its sources, extent, movement, and ultimate disposition have been until recent years things of mystery not only to the man who was financially interested in their development, but also to the engineer. The demand for information and the exceptional opportunity afforded in southern California for scientific study of the principles governing ground water have led to investigations of the subject by various branches of the United States Government as well as by other organizations. The results of such investigations have made possible certain definite conclusions which have been sufficiently verified to be accepted as fact.

The commercial ground waters of southern California occupy the voids around the particles of gravel and sand filling the closed structural basins represented by the topographic valleys.[1] Each of these basins is a subterranean reservoir for ground water whose supply is water which percolates downward from flowing surface streams and from precipitation upon the surface of the gravels.[1] The natural outlet from these reservoirs is by spring and seepage flow into surface channels, by evaporation from damp soils and vegetation and, to a limited extent, by underflow.[2] The average annual rate of recharge by percolation equals the aggregate rate of outflow through these various available channels.[2] It follows from these facts that water artificially extracted from a basin either by pumping or through artesian flow, which does not return by percolation, reduces by that amount the volume of water passing from the basin by way of natural channels. It is also apparent that the average amount of water artificially drawn from a ground water reservoir can not exceed the rate of recharge less the natural overflow without seriously lowering ground water levels.

The amount of water developed from many of the large basins of southern California is dangerously near the limit, so that methods of conserving and increasing the available supply are necessary. This can be accomplished artificially either by the reduction of natural evaporation losses from areas of shallow ground water, or by increasing the volume of water percolating into the gravels. Both methods can and are being employed to increase the volume of commercially available ground water. This paper describes the methods used to artificially increase the supply by percolation from waste flood water in the San Bernardino Valley, California, discusses the observed effect of the work already done and its future possibilities.

[2] Lee, Charles H., Water-Supply Paper U. S. Geol. Survey No. 294, 1912.

The investigations were carried on for the California State Conservation Commission under the direction of the writer who received valuable suggestions and advice from Mr. W. C. Mendenhall of the United States Geological Survey. Field work was commenced in March, 1912, and continued until November 1st. It is unfortunate that the available time and funds did not permit the extension of the work through a whole year, so that a careful field study of natural percolation from stream channels could be made and more complete well data gathered.

A large part of the detail field work was done by Mr. W. H. Spear, who also assisted in the preparation of maps and tables accompanying the report. Much valuable information was obtained from the Riverside Water Company, whose officers supplied all data in their possession which would throw light on the problem. The Water Conservation Association also furnished their records and rendered every possible assistance in carrying on the work.

WATER SPREADING.

The possibility of increasing ground water supply in southern California by artificially checking winter floods from the mountain canyons and spreading them over the porous gravel slopes first suggested itself to those interested in water development about twelve years ago. The extreme drought of the preceding years had led to the adoption of every conceivable method of water development. It was often observed that while stream channels were absolutely dry at points some distance from the mountains, there would be water flowing from the canyons above even in midsummer. The great reliability of ground water sources from which water could be obtained by artesian or pumped wells was also beginning to be apparent. The dependence of underground water supplies upon percolation from surface waters was a natural conclusion. Prof. E. W. Hilgard was probably the first to suggest in scientific literature the possibility of artificial replenishment of ground water supplies.[1] He proposed the storage of a portion of the waste flood waters of the Santa Ana River and Mill Creek by spreading them over the broad gravel slopes on either side of Santa Ana River, and regarded such a procedure to be as practical as surface storage in the mountains. The first attempt to put the idea into practice was made earlier than 1900 by the Gage Canal in diverting the Santa Ana floods on to the sandy wash below Orange Street. During the winter of 1901 some of the local water companies at Pomona did similar work on the débris cone of San Antonio Creek.[2] The results were encouraging in both localities and the work was continued. During the last few years similar work has been done on Lytle Creek, San Jacinto River, Santiago Creek, and San Gabriel River with satisfactory results. The idea has, therefore, passed the experimental stage as a method of flood water conservation. There remains, however, much engineering work to be done in devising methods and structures for diverting torrential flood waters and getting them into the gravels before reasonably complete conservation is possible.

[2] Tait, C. E., The Use of Underground Water for Irrigation at Pomona, Cal., Bull. U. S. Dept. Agr. Office of Exp. Stas., No. 236, 1912.

History of Santa Ana work.

The term "water spreading" has been used locally in the San Bernardino Valley to describe the diversion of flood waters from the channel of the Santa Ana River and their distribution over the adjacent lands. The work was carried on through the individual efforts of the Riverside Water Company and Gage Canal prior to the year 1909. The value of the work was recognized, however, and efforts were made by the local water companies and public-spirited citizens to provide for its future permanency. In the spring of 1909 the federal government by legislative act set aside certain public lands to be used as spreading ground. (Statutes 36, page 641, under date of February 20, 1909.)

> *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.* That all of the public lands in section eight, township one south, range two west, and in sections two, four, eight, ten, and twelve, in township one south, range three west, San Bernardino base and meridian, in the State of California, are hereby withdrawn from settlement and entry and reserved for the purpose of aiding in the conservation of the waters of the San Bernardino Valley: *Provided,* that this act shall not defeat any vested right which has attached under any pending entry or location.
>
> SEC. 2. That any individual or association of individuals, or any company or corporation may have the right under such rules and regulations as the Secretary of the Interior may prescribe, to conduct to said lands and to distribute over them any flood or waste waters not otherwise appropriated, and to build the necessary engineering works, for this purpose, to the end that said flood or waste waters may sink into the sands and gravels of said lands, thereby increasing and replenishing the supply of underground water in the San Bernardino Valley.

The lands thus set aside are practically worthless as agricultural land, being composed of wash material situated in the lowest depression of the valley to the north of the present flood water channel of the Santa Ana (Plate I). These lands are desirably located for the purpose of spreading water, however. They are described according to the public survey as follows: The southwest quarter, south half northwest quarter, northwest quarter southeast quarter, section 8, township 1 south, range 2 west, San Bernardino meridian; northwest quarter, north half southwest quarter, southwest quarter southwest quarter, north half southeast quarter, southwest quarter southeast quarter, section 12; southeast quarter southeast quarter, section 2; northwest quarter northeast quarter, south half northeast quarter, south half southeast quarter, southwest quarter, south half northwest quarter, section 10; east half northeast quarter, section 4; township 1 south, range 3 west, San Bernardino meridian, and comprise 1,240 acres. There are 80 acres of this in the east half northeast quarter, section 4, township 1 south, range 3 west, which are too high to be reached from Santa Ana River, but which lie across the channel of City Creek and can be used for spreading water from that stream.

An organization of citizens representing the local water companies was perfected June 2, 1909. It was named the "Water Conservation Association" and was organized as a coöperative association incorporated under the laws of the State of California. The articles of incorporation of the Association are as follows:

Know all men by these presents that the undersigned have associated themselves together to form a coöperative association, under and in accordance with the provisions of Sections 653b to 653l of the Civil Code of the State of California, and for that purpose hereby state and certify that:

(1) The name of said corporation is WATER CONSERVATION ASSOCIATION.

(2) The purpose for which it is formed is to conserve the surface and subsurface waters of the Santa Ana River and its tributaries situated in the counties of San Bernardino, Riverside and Orange, in the State of California:

a. By spreading the winter flood waters of said river and its tributaries, in the San Bernardino basin and elsewhere, over such lands adjacent to the channel thereof, as may be available for that purpose.

b. By securing control of such lands as may be necessary or desirable for such spreading, by purchase, lease, gift, donation, license or other methods, as may be found most desirable.

c. By the construction, maintenance and operation thereon of such works as may be found most advantageous and desirable for the purpose.

d. By prevention of waste of artesian and subsurface waters of said stream and the tributaries and sources of supply thereof, by the enforcement of the law of this State prohibiting waste of such water, and by securing evidence of such violation, and by the prosecution of the violaters of said law.

e. By such other methods of conserving the waters of said stream and its tributries as the Board of Directors of the association shall determine.

(3) The place where its principal business is to be transacted is the office of the Riverside Water Company, in the city of Riverside, county of Riverside, State of California.

(4) The term for which it is to exist is fifty years.

(5) The number of directors thereof is nine; three of whom shall be residents of the county of San Bernardino, three residents of the county of Riverside, and three residents of the county of Orange.

(6) The names and residences of the directors selected for the first year, and to serve until the election and qualification of their successors are as follows:

Names.	Residences.
Herbert N. Garstin	Redlands, Cal.
Geo. M. Cooley	San Bernardino, Cal.
Kenneth MacRae	Rialto, Cal.
W. G. Fraser	Riverside, Cal.
E. O. Rickard	Riverside, Cal.
Francis Cuttle	Riverside, Cal.
Wm. McLaughlin	Anaheim, Cal.
M. Nisson	Santa Ana, Cal.
E. E. Keech	Santa Ana, Cal.

(7) The amount which each member is to pay upon admission, as membership fee, is five ($5.00) dollars and each member signing these articles has actually paid in said sum, and that the interest and right of each member therein are to be equal.

This Association has been active in carrying on the work since its organization. An effort has been made to acquire lands lying between the areas reserved by the government so as to command a continuous strip one mile in width from the mouth of Santa Ana Canyon to the lower part of the valley (Plate I). So far there have been purchased from private ownership 680 acres, described as follows; west half southeast quarter, section 7, township 1 south, range 2 west; east half, and northwest quarter, section 11; and north half southeast quarter, northeast quarter of northeast quarter, section 10, township 1 south, range 3 west. There has also been secured the right to flood 240 acres owned by the city of Redlands, namely: south half northeast quarter, and southeast quarter, section 9, township 1 south, range 3 west. In addition to these lands, the Riverside Water Company owns the north half northwest quarter, and north half northeast quarter, section 9, township 1 south, range 3 west, upon which water is spread, and the Riverside Trust Company southeast quarter, section 8, southwest quarter and south half northwest quarter, section 9, township 1 south, range 3 west, which the Association has the right to flood. There are thus 2,640 acres of land now controlled by the Association along the Santa Ana River for the purpose of spreading flood water.

A notice of appropriation of water, as required by the laws of California, was posted by the Association October 3, 1911, at two points along the flood water channel of Santa Ana River on government land withdrawn from entry. The appropriation is for 25,000 miner's inches measured under a four-inch pressure, which is equivalent to 500 second feet. The text of the notice is as follows:

> The undersigned hereby claims 25,000 inches of water measured under a four-inch pressure flowing in the channel of the Santa Ana River at the several points where this notice is posted, to wit:
>
> 1st: At a point from which the quarter section corner on the south boundary line of section 8, T. 1 S., R. 2 W., S.B.M., bears south 14 deg. 0 min. E. 2,066 feet.
>
> 2d: At a point from which the quarter section corner on the east boundary line of section 12, T. 1 S., R. 3 W., S.B.M., bears north 47 deg. 10 min. east 1,810.10 feet.
>
> All such points and places of diversion being located on the public reservations of the United States.
>
> The purpose for which the same is claimed is to conserve such waters by spreading the winter flood waters of said river and its tributaries over certain lands, to wit:
>
> 1st: All of the public lands in section 8, T. 1 S., R. 2 W., and in section two, four, eight, ten and twelve in T. 1 S., R. 3 W., S.B.M., in the State of California.
>
> 2d: The west half of S. E. quarter of section 7, in T. 1 S., R. 2 W., S.B.M., State of California.
>
> 3d: The east half and the N. W. quarter of section 11, T. 1 S., R. 3 W., S.B.M., State of California.
>
> 4th: The N. E. quarter of the N. E. quarter and the N. half of the S. E. quarter of section 10, T. 1 S., R. 3 W., S.B.M., in the State of California.
>
> 5th: The south one half of the N. E. quarter and the S. E. quarter of section 9, T. 1 S., R. 3 W., S.B.M., in the State of California.
>
> The means by which it is intended to divert said waters is by a headgate or boulder dam, or both, ditch, iron pipe, and flume or any or either of such means as may be found most practicable. The size of such ditch at the first point of diversion named above is to be 16 feet wide and 3 feet deep and the size of such ditch at the second point of diversion named above is to be 20 feet wide and 3 feet deep, or larger if necessary, to carry the amount of water here claimed. In event that it should be deemed advisable to construct an iron pipe or flume, or both at such points of diversion, such iron pipe and flume are to be of sufficient capacity to carry the amount of water here claimed.
>
> Dated: October 3, 1911.
>
> WATER CONSERVATION ASSOCIATION.
> (Signed) By FRANCIS CUTTLE, President.

The Association has also been active in making provision for carrying on systematically and permanently the work of spreading water. A one-story concrete building with floor space about 20 feet wide and 40 feet long has been erected on the northwest quarter southeast quarter, section 7, township 1 south, range 2 west, land which is owned by the Association. Here men employed in the water spreading work are housed during the flood flow period and during the remainder of the year the building serves as a storehouse for tools and equipment used on the work. There has also been constructed a concrete headgate (Plate II, A) on the north bank of the Santa Ana near the mouth of the canyon at the point where the first notice of appropriation was posted. From this point, from a point opposite the junction of Mill Creek, the point of filing of the second notice of appropriation just below the Santa Fé Railroad bridge, rough ditches have been laid out and constructed to carry flood waters from the river channel on to the spreading grounds (Plate II, B). Concrete weirs (Plates II-A and III) with sheet steel crests have been installed in each ditch near the headgates. The middle diversion ditch crosses Orange Street, leading from Redlands to East Highlands, and an appropriate concrete culvert has been built at this point to carry the water underneath the road. In addition to making these various improvements the Association has kept a foreman and three or four men at work each season diverting and spreading flood water. The making of improvements and the work of water spreading have been done under the direction and direct supervision of Mr. C. S. Wilson, who is also superintendent of the Riverside Water Company. Mr. Francis Cuttle, of Riverside, is president of the Association and has taken a very active interest in the work, being largely responsible for the organization of the Association and the progress thus far attained.

The funds of the Association are derived from membership dues and from assessments levied upon the companies represented by the members, namely: Gage Canal Company, Riverside-Highland Water Company, Riverside Water Company, and Santa Ana River Development Company. The expenditures of the Association to June 12, 1912, have been very kindly furnished by Mr. Cuttle and as they indicate in a general way the size of the work they will be stated. The cost of all improvements, including the building, headgates, weirs, ditches and culvert, has been $4,371.66. The real estate has cost $2,853. The tools purchased to date amount to $163.83. Operating expenses for three seasons, 1909-10 to 1911-12, were $3,619.45; during the season 1911-12 were $903.46, and average about $1,200 per season. The total expenditures to June 12, 1912, were $11,007.94.

Method of spreading water.

The area over which the flood waters of the Santa Ana are being spread is the surface of the alluvial slope in front of the mouth of Santa Ana Canyon, which the river has built up with alluvial material carried by it from the canyon. The carrying power of a stream depends upon the velocity of the water, which in turn depends upon the grade. The grade of the stream in the canyon is so steep that boulders several feet in diameter are moved during severe floods and smaller boulders are carried along like pumpkins. The thundering of these stones as they strike one another in their mad rush can be heard several miles away. The larger boulders are all deposited at and near the mouth of the canyon at the apex of the cone. Smaller boulders, coarse gravel, fine gravel and sand are deposited in the order named as the stream velocity becomes less and less in passing down the slope. Oftentimes the channel will be so choked with débris near the canyon mouth that a subsequent flood finds a course for itself in an entirely new position on the slope. This channel in turn is abandoned for some other, leaving two parallel lines of boulders to mark the old position. Thus the upper portion of the slope is a jumble of boulder heaps and ridges. In passing down the slope there are small clear spaces of gravel and sand which increase in area to the lower slope, which is one broad unbroken surface of sand except where cut by the present river channel. The length of this slope from the mouth of the canyon to the valley floor is about ten miles and it occupies the full width of the valley, finally merging into the main San Bernardino Valley.

The first attempts at water spreading were made by the Riverside Trust Company for the purpose of increasing the supply of the Gage Canal. It was noticed that while the large floods were in progress the débris-laden water was confined to no definite channel on the middle and lower portion of the alluvial slope, but spread out in a broad sheet obliterating all existing channels. As the flood abated this sheet became comparatively shallow and a large proportion of the flow at the mouth of the canyon would be absorbed by the gravels before reaching the region of shallow ground water near the head of the Gage Canal. As the flow still further decreased, however, the stream would leave the canyon without a load of sand and gravel, and as it advanced down the slope would cut a more definite channel for itself in some portion of the broad flood channel. The broad sheet was thus concentrated into a relative narrow and deep stream with a minimum area of water surface in contact with the absorbent gravels. Under these modified channel conditions a much smaller stream would flow across the gravel slope to the region of shallow ground water than was possible immediately after the flood crest had passed. Water thus entering the region of shallow ground water passed the Colton dike and was lost to the ocean.

The idea which guided the work of the Riverside Trust Company was to artificially maintain the early channel conditions of a waning flood. This was done by throwing up temporary embankments across the broad flood channel just as soon as the fury of a flood had abated, so that the water could be checked and ponded, and if necessary spread out laterally from the channel. The work was done between Orange Street and the head of the Gage Canal, where the slope flattens out and broad areas of fine gravel and sand lie adjacent to the flood channel. The method proved effective in conserving the flow of the Santa Ana during and after the period of channel readjustment which follows the larger floods. It was not possible to control the main body of the flood by this method. Furthermore, by spreading the water so near the region from which ground water was developed for use, the practical effect was merely to store the water from spring to the following summer. Although such monthly regulation is good, yet the crying need on all southern California streams is for annual storage regulation. When the dry year comes without its spring floods, there will be no water for spreading and it is then that water stored during the preceding wet years should be at hand. This can be accomplished by spreading the flood water higher up on the slope. This idea has been followed to a certain extent by the Water Conservation Association. The general method used by the Association in getting the flood water into the gravels is to divert a large head of water from the river, carry it in a contour ditch, or established channel, to land suitable for spreading and there distribute it into smaller ditches from which it is further distributed and finally allowed to spread out over the surface and sink into the gravel. The best spreading ground has an unbroken surface with gentle slope and more or less desert vegetation. The soil should be free from clay or silt. The finer wash material composed of sand and gravel is very good. The area of good spreading ground is very limited on the upper alluvial slopes. There is a greater proportion on the middle slope between the Santa Fé Railroad and Orange Street, and below Orange Street almost all of the ground can be used to advantage. In handling the water great care must be exercised to prevent it from cutting. As soon as a small channel in the natural surface is formed,

Plate II-A. Upper diversion ditch.

the water will start flowing rapidly and cut deeper and wider until a wash is formed, down which water goes with a rush and can not be controlled. The most effective percolation occurs when the water moves slowly over the unbroken natural surface. The water can actually be seen to disappear as it advances in a thin sheet over such surface.

The three ditches which are being used are shown on Plate I. They are situated so as to command most of the lands available for water spreading. The upper ditch is about half a mile in length and follows generally the contour of the land (Plate II-A). It diverts water from the north bank of the main wash about one mile below the mouth of Santa Ana Canyon and carries it in a general northwest direction to be spread on the smoother lands below the ditch. The surface of the alluvial slope immediately below this ditch is somewhat broken by old channels and boulders, but there are numerous small areas of gravel and sand which afford fair ground for spreading. The area of such land is probably less than 100 acres. The general grade of the land below this ditch is about 200 feet per mile.

The middle diversion system has a capacity approximately equal to the combined capacities of the two other ditches. Its length is about four miles. The point of diversion from the main channel of the river is about one third of a mile west of the junction of Mill Creek. The diversion channel follows the natural slope and is locally known as the North Fork of Santa Ana River, being an old flood channel of the river. Ditches have been constructed from various points along this channel, through which the water is led on to the adjacent lands. The grade of the land along the upper portion of the channel is about 125 feet per mile and decreases to 50 feet and less per mile toward the lower end. Water can be carried to both the middle and lower alluvial slopes through this channel. During 1912 considerable water was carried through it to the lands west of Orange Street.

The lower ditch diverts from the north bank of the main Santa Ana just below the Santa Fé Railroad crossing. It has a length of possibly two miles, follows generally the slope of the ground, and consists of both artificial and natural channels. The slope of the adjacent ground is about 120 feet per mile. The ditch covers some very good water spreading land between the main wash and the middle ditch.

The work of the men engaged in water spreading is to keep the main ditches in repair, to lead the water into the lateral and sublateral ditches, and to keep the water under control by preventing it from cutting. Portions of the ditches are excavated in the sand and gravel and other portions are diked so that constant watching is necessary when they are carrying large heads of water. The distribution of water needs to be continually rearranged as certain areas become temporarily saturated or water commences cutting. It has been found very desirable not to break the natural surface with a shovel for such places give the water opportunity to start cutting. Many of the laterals are constructed by shoveling out a small trench which the water will soon excavate to the desired size. The area over which the water has been spread thus far is a very small proportion of that available. The first two years' work was carried on above Orange Street, but in 1912 considerable spreading was done west of the street, where conditions were very favorable for spreading a large volume of water at small cost. Four men are kept busy full time during the spreading season in handling the water which is diverted.

The floods of the Santa Ana are torrential in character and in their early stages carry large quantities of fine silt, the result of abrasion of the gravel and boulders which the stream picks up and transports down the canyon. As long as the water maintains its high velocity this silt remains in suspension, but when diverted into the contour ditches and spread out on the surface the silt settles and forms an impervious skin over the surface. This slime completely seals the porous materials from the entry of percolating water and thus greatly reduces the efficiency of the water spreading work. The policy has been not to take this silty water into the ditches. When a flood occurs the headgates are closed and not opened until the water clears again, usually after the lapse of two or three days. The large floods are so violent that the rough boulder diversion dams are often carried away and the present headgates would probably be endangered if it was attempted to divert during the high stages. Hence with the existing methods and equipment it is not desirable to attempt to spread water during period of maximum flood flow.

Amount of water spread.

There has been no record kept of the amount of water diverted and spread prior to the spring of 1912. It is estimated by Mr. John Heaslet, engineer for the Riverside Water Company, who was familiar with the work done by the Conservation Association, that there were from ten to twenty second-feet diverted for possibly three months during the winter of 1908–09. The amount diverted in 1909–10 was less than this, due to the small winter flow of the streams. In 1910–11 Mr. Heaslet made three sets of current meter measurements, as follows: February 21st, upper ditch 20 second-feet; middle ditch 27 second-feet; lower ditch 40 second-feet, or 87 second-feet total; March 1st, upper ditch 22 second-feet; middle ditch 30 second-feet; lower ditch 40 second-feet, or 92 second-feet total; May 20th, upper ditch 22 second-feet; middle and lower ditches dry. The high water period of that season extended from January 24th to about May 1st. The maximum total amount diverted during the season was probably not in excess of 92 second-feet and can be reasonably considered as 75 second-feet for one hundred days or about 15,000 acre feet.

There were weirs installed in the three ditches just below the headgates in the fall of 1911, prior to the first appearance of flood water. These were constructed of concrete and steel, there being a wall of concrete across the ditch section with a sheet steel plate imbedded in it. The weir notch was of the rectangular type with complete end contractions, length of crest 10 feet, depth of notch 2 feet. The conditions are not ideal for accurate measurements, the steel being set into the concrete too far to give good sharp-crested conditions. The upper weir has insufficient free fall (Plate II, B), while the middle weir has high- (Plate III) and the lower weir medium-velocity of approach.

Plate II-B. Headgate and weir at head of upper diversion ditch.

Sand tends to collect rapidly behind the weirs so that it requires constant attention to keep them in condition for use. Observations were made daily during the spring of 1912 by the foreman of the

Plate III. Weir on middle diversion ditch.

water spreading crew who used a carpenter's foot rule and observed to the nearest inch the depth of water over a stake set level with the weir crest. The results of his measurements are presented in Tables 1 to 3. The river channel was entirely dry until early March, 1912, so that the spreading season was short. The total amount diverted was 9,157 acre-feet with a maximum daily discharge of 137 second-feet. Practically all of the water diverted has been absorbed before returning to the wash. The maximum combined discharge capacity of the present diversion works and ditches is not in excess of 250 second-feet and it is doubtful whether four men could handle this amount of water and at the same time keep the main ditches in repair.

Summarizing it can be said that the amount of water spread by the Association during the season 1908–09 was between 2,000 and 3,000 acre-feet and that the volume of water spread in any preceding season did not exceed this. The amount spread in 1909–10 was less than that spread during 1908–09. During the season of 1910–11 the amount spread was about 15,000 acre-feet and during 1911–12 was 9,157 acre-feet. The annual operating cost has averaged about 10 cents per acre foot of water spread, and interest at 6 per cent on the permanent investment 4 cents per acre-foot. The duty of water varies from 2 to 3 acre-feet per acre per year in this region. Hence the annual cost of storing surplus flood water in the gravels is less than 30 cents per acre irrigated therefrom. The average annual return per acre from irrigated land in the vicinity of Riverside is stated to be $150. The cost of subterranean storage is therefore very reasonable.

Observations by Water Conservation Association.

Other efforts at water spreading.

The subterranean storage of waste flood water has been tried not only on Santa Ana River, but on San Antonio, Lytle and Santiago creeks and San Jacinto and San Gabriel rivers. There have been somewhat different methods employed on some of these streams for bringing the water in contact with the gravels and an interesting comparison can be made. The writer visited the spreading ground on San Jacinto River and Lytle Creek, and saw the work in progress. The work on both these streams is being carried on in restricted ground water basins, which can be easily controlled by a single financial interest as regards inflow and draft. Water which is absorbed by the gravels can be developed at a lower point later in the season with almost absolute certainty.

The Turk Basin on Lytle Creek is an enlarged portion of the Lytle Creek Canyon, two miles above its mouth, which is filled with the coarse débris deposited by the upper stream. The bedrock walls of the cañon almost meet at the entrance and exit of the basin, but between, widen out to a distance of more than half a mile. The length is a little greater than one mile and the slope of the ground surface nearly 200 feet per mile. The basin is operated by the Fontana Development Company as a monthly storage regulator of the flow of Lytle Creek. The company diverts the flow of the stream for irrigation uses, and reports that the water spreading work is very effective in increasing the gravity flow during the late summer at the lower end of the Turk Basin. The restricted area of contact and the steep grade of the surface have led the company to adopt the ''shaft'' method in getting the water into the gravels. This consists in sinking shafts into the porous material of the upper basin and diverting flood water into them to be absorbed by the surrounding formation.

The shafts are located in the upper and middle part of the basin and are approximately 4 by 6 feet in cross section. They were sunk to porous gravels and varied in depth from 50 to 70 feet below the surface. They are lagged with 2 inch redwood lumber with 8 and 10 inch horizontal sets, each set separated by a $\frac{3}{4}$-inch space. Settling basins are provided near each shaft but flood waters are not admitted until the stream clears of silt. The engineer of the company, Mr. C. M. Racor, reported that the shafts would take from one to two second-feet each. The company has about 12 shafts in this basin. Water is diverted from the creek by means of a temporary boulder dam which each flood carries away. The operating expenses consist of the labor of three or four men a day, for a day or two after each storm, who rebuild the dam, and look over the distributing ditches and shafts. This method is particularly adapted for use on steep ground where desirable spreading area is limited. The cost of the shafts is about $5 per foot. Assuming they were sunk 75 feet, absorbed 300 acre-feet per year and had a life of five years, the interest and depreciation cost would be 32 cents per year per acre-foot. The method might be employed to advantage on the Santa Ana fan above the Santa Fé Railroad.

The work on San Jacinto River is being carried on by the Citizens Water Company below the mouth of the canyon and at the head of San Jacinto Valley. There is a more or less distinct basin here formed by the granite range to the north and the relatively impervious fan of Bautista Creek. The outlet of this basin is at the cienaga, located just above the junction of Poppet and Bautista creeks with San Jacinto Wash, at which point the company has installed a pumping plant. The spreading ground is situated along the river channel for several miles above the cienaga. The surface is an unbroken slope of sand with a grade of from 50 to 30 feet per mile. The basin method is being employed here. Areas of several acres extent are enclosed with levees thrown up by teams and scrapers. Water is diverted from the river into the highest basins and overflows successively into the next lower basins. It is stated by Mr. Kingsbury Sanborn, engineer for the company, that the rate of percolation was in some cases as high as 5 second-feet per acre. It was found necessary to plow up the floor of the basins two or three times during the first season to break the silt deposit, and eventually it will be necessary to remove the silt from the basins. This method is well adapted to gently sloping ground, and with certain modifications might prove more effective on the Santa Ana fan in controlling the large floods than the broadcast spreading now practiced by the Water Conservation Association.

THE SAN BERNARDINO GROUND WATER RESERVOIR.

A study of the effect of water spreading over the Santa Ana fan upon ground water levels, and artesian flow in the San Bernardino Valley, is so closely related to the broader subject of natural ground water storage in the valley, that a brief description of the basin is advisable before considering the problem.

Generally speaking the basin is an ancient valley buried deep beneath modern alluvial material which has been transported from the San Bernardino Mountains by torrential streams which drain its southwestern slope (Fig. 1). The rim of the basin along the north and northeast is the steep rock face of the San Bernardino Range, along the south it is limited by the Crafton Hills and the relatively impervious formation referred to by Mendenhall as the older alluvium;[1] while it is closed on the west by a buried ridge known as the Bunker Hill dike[1] whose higher elevations appear as mounds above the modern alluvial material. There is a gap through this ridge in the vicinity of the present channel of the Santa Ana River. This gap is filled with alluvial material and the present river channel is but a few feet lower than the crest of the ridge. The gap was cut by the Santa Ana River in former geologic times. The bottom of the gap is the lowest depression in the impervious rim of the basin and the superimposed ground surface above is the lowest depression of the present topographic boundary. Hence this vicinity is the natural and sole outlet of both surface and subterranean waters which flow from the basin.

---

[1] Mendenhall, W. C., Hydrology of San Bernardino Valley, Cal., Water-Supply Paper No. 142, U. S. Geol. Survey, 1905, pp. 30-34.

The floor of the basin has varied topography which is probably very similar to that of the Perris and San Jacinto regions with their level valleys surrounded by hills and mountains. The depth of alluvial material exceeds 1000 feet in a deep well bored by the city of San Bernardino about one mile east of town. Less than 1½ miles north of this well the bedrock rises 150 feet above the surface at Perris Hill (Plate I). Similar conditions occur in other parts of the valley, but it is impossible to state the detail of this buried topography. There seems to be one feature, however, which is fairly well defined, namely, a range of hills lying about 2½ miles from and almost parallel with the base of the San Bernardino Range, extending from the point of the ridge between Lytle Creek and Cajon Wash in a southeast direction to the highest peak of the Crafton Hills. This range shows itself in the form of buttes and hills, such as Perris Hill, which rise from the surrounding alluvial material to various heights, and by low mounds not so prominent but of the same rock formation. There are three of these mounds along the flood channel of Mill Creek, just above its junction with Santa Ana Wash. The top of buried portions of this ridge have also been encountered at several points, as in the wells sunk by the city of San Bernardino at the new Perris Hill pumping plant, and in a well sunk near the east quarter corner of section 36, township 1 north, range 4 west.

The exact way in which the subsidence of this old topographic surface occurred and the resulting deep basin filled, will probably never be fully understood. The various streams from Cajon Wash to Santa Ana River all assisted in the filling of the basin. There is not enough evidence to determine whether the flow from all these streams was originally deflected to a common point of discharge through the hills, or whether several outlets existed. There are indications, however, that Plunge Creek, City Creek, and other small creeks to the southwest, and possibly Santa Ana River were thus deflected and found a common outlet, at the point of lowest depression which appears to have been near Harlem Springs. The fact that a portion of the bedrock has been cut away from the mountain slope at the west side of the mouth of Santa Ana Canyon, and that none of the older alluvium appears along the base of the range between Santa Ana and Plunge Creek canyons, would indicate that the Santa Ana River was deflected sharply to the west at some time during its history. The period was one of very active erosion and although at first the stream may have deepened the depression through which it passed, the coarse débris ultimately filled the long narrow valley and eventually the outlet. Individual outlets were then found at higher levels and eventually the streams swept over the tops of all but the highest peaks.

The early condition of the main basin was probably that of a deep lake. After the lake was drained the course of an important drainage channel from the San Bernardino Mountains was probably through the defile at Harlem Springs along the general position of Warm Creek, and through the gap in the dike. Mill Creek flowed directly west to the same gap and may have been joined by a large stream from the south. Lytle Creek also assisted in carrying alluvial material into the basin. The ultimate result of the work of these streams was to build up the floor of the valley to its present level and fix the present drainage lines. During all this time periods of great erosional activity were followed by those of comparative quiescence. Hence the material which fills the basin is a series of alternating layers of coarse gravel with sands and clays. There is every reason to believe that a continuous body of coarse material extends from behind the ridge of hills near the San Bernardino Mountains through the Harlem Springs defile and into the main basin, where it is spread fan-shape between layers of impervious clay. The relation of this body of gravel to that deposited by Mill Creek and its tributary and Lytle Creek is difficult to determine, as is also the relation of superimposed gravels carried at a later period over the crest of the ridge of buried hills. The clays, however, are limited to the lower part of the valley and probably do not extend much beyond the original artesian boundary mapped by Mendenhall.

The San Bernardino basin is thus a large structural basin filled with alluvial débris. This material is composed of coarse gravels in a wide zone along the base of the San Bernardino Mountains from Lytle Creek to Crafton Hills, and well out into the valley north of Redlands. Within the area of the central depression of the present valley the gravels are inter-bedded with clays. The natural drainage outlet is situated three miles directly south of the city of San Bernardino.

The void spaces of this gravel, which vary from 20 to 35 per cent of the total volume, constitute the water storage capacity of the basin. The sources of water supply are percolation from those portions of stream channels which are porous, percolation from irrigation water, and percolation from direct precipitation upon porous surface material. The first of these sources is the most important.

The movement of water percolating from streams is downward and laterally into the gravels to the broad surface of the permanent ground water body. The movement is then termed seepage and is down the ground water slope toward the region of lowest depression. The progress of seepage waters is variable and in all cases slow.[1] The lower portion of the valley to the south and east of the city of San Bernardino is the ultimate goal of all waters entering the gravels from whatever source.

Water filling the gravel strata beneath the clays of the central valley are under considerable hydrostatic pressure from ground water in the gravels at higher levels nearer the sources of supply. Such water is termed artesian and breaks through the clay where it is weak, thus forming springs and seepages which give source to such streams as Warm Creek and its tributaries. The ground water level within the area of shallow artesian pressure is near the surface, and causes the swampy conditions so noticeable to the east and south of San Bernardino. Artesian water is drawn upon artificially by means of deep casing wells which puncture the overlaying clays. There have been more than one hundred such wells drilled within the artesian area.

---

[1] Mendenhall, W. C., Water-Supply Paper No. 142, U. S. Geol. Survey, 1905, pp. 49-50.

The basin is a great subterranean storage reservoir. Hence all water that enters it must have an outlet. The natural outlets are by subsurface flow through the gap in the Bunker Hill dike, by evaporation from the swamp and moist lands overlaying the artesian area, and by overflow of springs and seepages into surface channels through which it flows from the basin across the dike. Warm Creek drains the north two thirds of the artesian area, and the channel of Santa Ana River the southern portion. The underflow at the gap through the dike is small in amount and need hardly be considered from a practical standpoint when studying the output of the basin as a whole. In recent years the artificial development of artesian and pumped water for use without the basin has constituted a fourth outlet. This artificial draft has correspondingly reduced the natural overflow from the basin by shrinkage of spring and seepage flow, and the evaporating area, but has not increased the total outflow. Considered as an average, natural inflow and outflow for the basin are equal in amount.

There are great monthly inequalities in the rate of recharge of the basin due to the concentration of annual precipitation and run-off into a few months of the year. There are also annual differences due to the broad annual variations of precipitation and run-off. These are shown to a certain extent in the rate of outflow from the basin. The monthly irregularities are registered by variable natural and artificial artesian flow; the annual changes by variation in the evaporating area as well as the amount of escaping artesian water. The major part of irregularities in inflow, however, is taken up by fluctuations of ground water level. This characteristic of a ground water storage reservoir gives it preëminent advantage over any other type of storage in a region subject to great precipitation extremes, such as southern California.

The problem of determining the effect of water spreading during the past few years upon the amount of water commercially available from the basin is solved by answering the following questions:

1. To what extent has water spreading increased the volume of water percolating into the gravels of the Santa Ana Fan?

2. Have ground water levels, artesian flow, or the boundary of moist land in any portion of the basin exhibited any fluctuations during the last few years which cannot be explained by variation in the rate of natural ground water supply?

3. Have ground water levels or output in any other ground water basin of southern California influenced solely by natural conditions, exhibited variations similar to those of the San Bernardino basin?

The remainder of this report presents and analyzes data which bears upon these questions.

WATER SUPPLY.

The ultimate source of water supply for the San Bernardino basin is precipation upon the valley floor and the tributary mountain slopes. The precipitation falling upon the mountains becomes available to the valley as run-off in the streams which flow from the various cañons or catchment areas. The percolation from stream flow is the most important source of ground water supply, but since stream flow is primarily dependent on precipitation a broadly accurate knowledge of fluctuations in the rate of ground water supply can be obtained from a study of precipitation records.

Precipitation.

The problem under consideration deals with the distribution of precipitation, not geographically, but with regard to time. A few records typical of the whole region are therefore sufficient as a basis of study. The records selected are those published by the United States Weather Bureau for San Bernardino, Riverside, Redlands, and Upland (Tables 4 to 7). The Weather Bureau record at San Diego is also presented because of the long period covered and general similarity of precipitation conditions (Table 8), and the record at Los Angeles in connection with ground water conditions in San Fernando Valley (Table 9). The records are arranged according to the season, July 1 to June 30, which correspond with the run-off season.

Number of years	42	42	42	42
Deduced mean	15.91	10.61	15.07	22.70

The longest record in the San Bernardino Valley is that at the city of San Bernardino which covers 42 seasons from 1870-71 to 1911-12. The Riverside record extends over 31 seasons, Redlands 23 seasons and Upland 20 seasons. The mean computed from the shorter records is not as reliable as that for San Bernardino. Since precipitation conditions are similar at the four stations deduced means were computed for the shorter records by comparing the precipitation at San Bernardino during the same period with the full period at that station, and applying the correction factors to the shorter term means (Table 10). The percentage relation that each season's precipitation bears to the long period mean and the average per cent for the four stations was then computed (Table 11). It will be observed that the percentages at various stations agree closely and the average gives a more reliable value than would a single record. It will be noted that seasonal precipitation varies from a maximum of two and one fourth times the mean to a minimum of two fifths of the mean. Also that periods of four consecutive seasons have occurred with precipitation both above and below normal. Ground water fluctuations should, therefore, be subject to wide variations from natural causes.

TABLE 11.

Seasonal variation of precipitation expressed as per cent of deduced mean for stations in San Bernardino Valley.

Season July 1 to June 30.	San Bernardino.	Riverside.	Redlands.	Upland.	Average per cent for each year of all stations.

The distribution of precipitation through the year is shown by Table 12. There is a marked wet and dry season. The rainy months are December to March, inclusive, during which 77 per cent of the seasonal total occurs. The dryest months are June to September, when four per cent occurs, while April, May, October, and November intermediate with a total of 21 per cent. The ground water reservoir is therefore recharged during the spring months.

It is difficult to grasp the general tendencies of annual variation in precipitation from tables. A diagram has therefore been prepared (Fig. 2), showing the excess and deficiency of precipitation with respect to the mean at typical stations. The variation from the mean for each year is shown by small circles. The general tendency is shown by a heavy line obtained by averaging progressively the precipitation of each three consecutive years. This process smooths out the minor irregularities and shows broad variations clearly. Although the amount of precipitation differs, yet the variations from year to year agree exactly at the four stations, San Diego, San Bernardino, Riverside, and Los Angeles. Beginning with the season 1883-84 there began a period of the heaviest rainfall observed during the last sixty years, which continued until 1891–92. It was followed by the period of most severe drought ever recorded in southern California, which continued to 1903-04. There were, of course, individual years in each of these periods which departed from the general tendency, but these single years had little effect either upon run-off or ground water levels. Since 1903–04 there has been a period of marked increase followed by one of generally normal character.

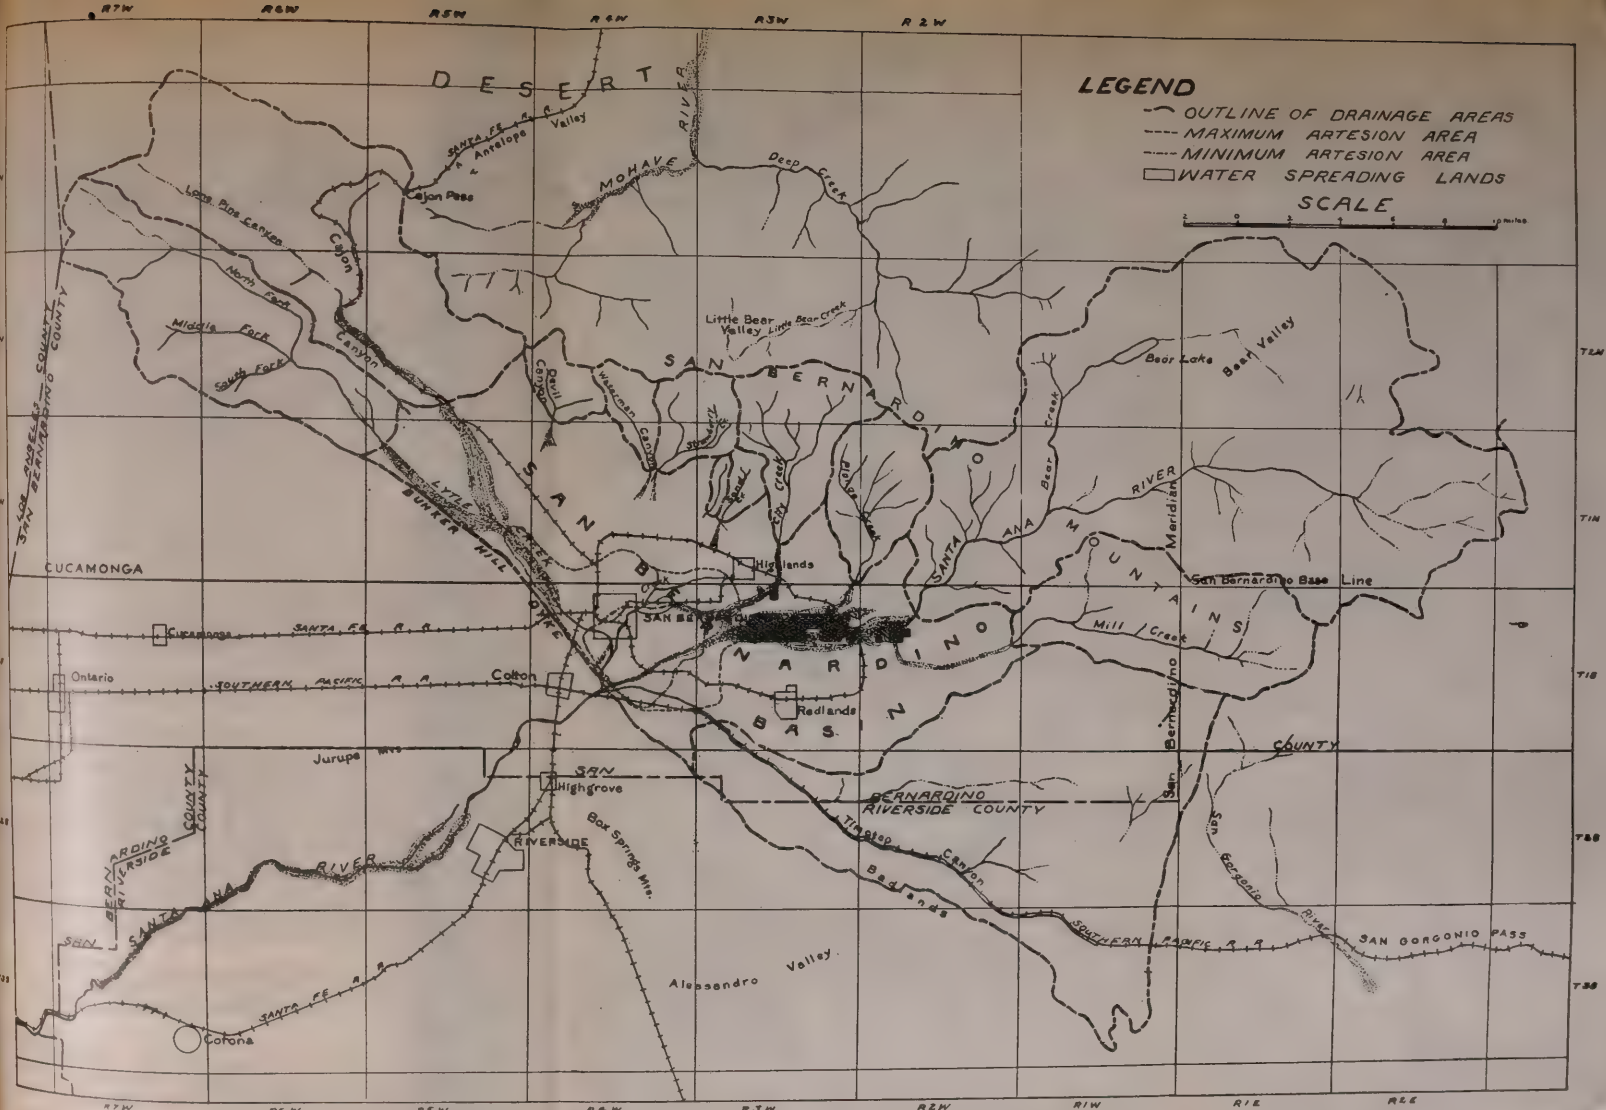

FIGURE 1 — GENERAL MAP OF SAN BERNARDINO VALLEY
SHOWING TRIBUTARY DRAINAGE AREA

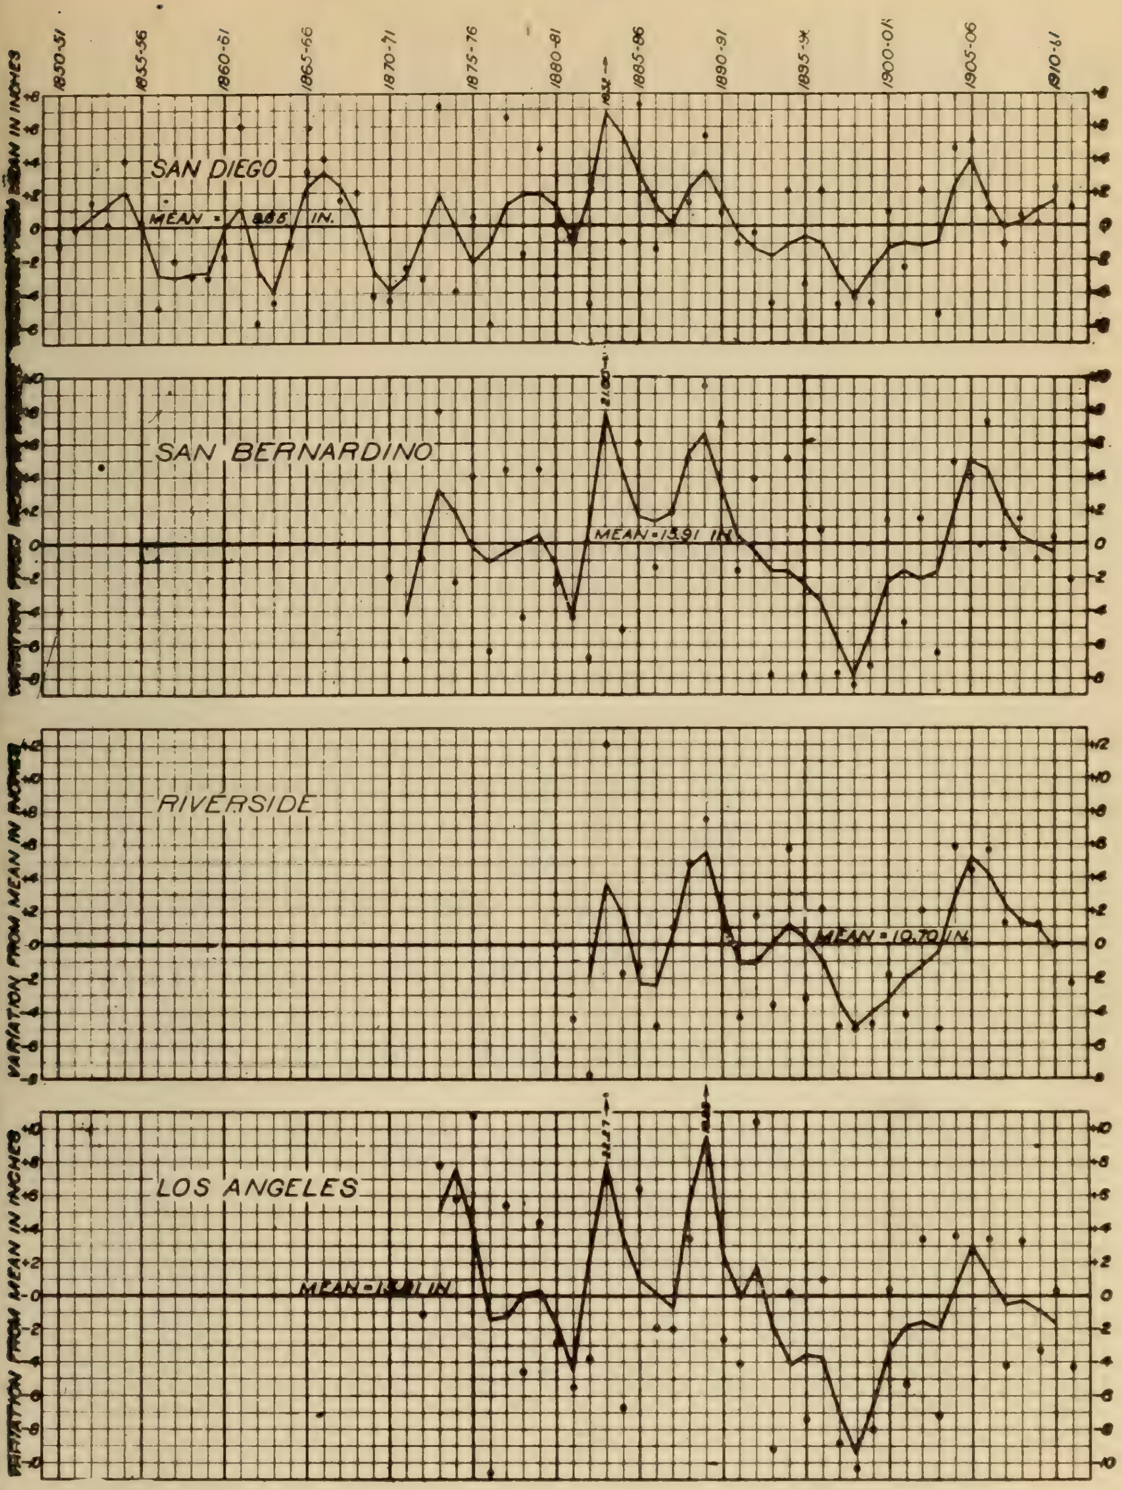

FIGURE-2-SEASONAL AND THREE YEAR PROGRESSIVE MEAN SEASONAL PRECIPITATION AT POINTS IN AND NEAR SAN BERNARDINO VALLEY. CALIFORNIA

Ground water levels do not rise and fall immediately with the seasonal variations in precipitation, since the effect of one year is carried on into the next by accretion or depletion of ground water storage. As long as annual rainfall is below normal ground water levels will fall. A period of normal rainfall would tend to arrest downward movement, but nothing short of a period of rainfall well above normal would bring about a complete reversal and recovery. The cause of fluctuations of ground water level can be shown best by a study of aggregate excesses and deficiencies of precipitation. A graph of such aggregates has the same general shape and tendencies as a graph of ground water fluctuations.[1]

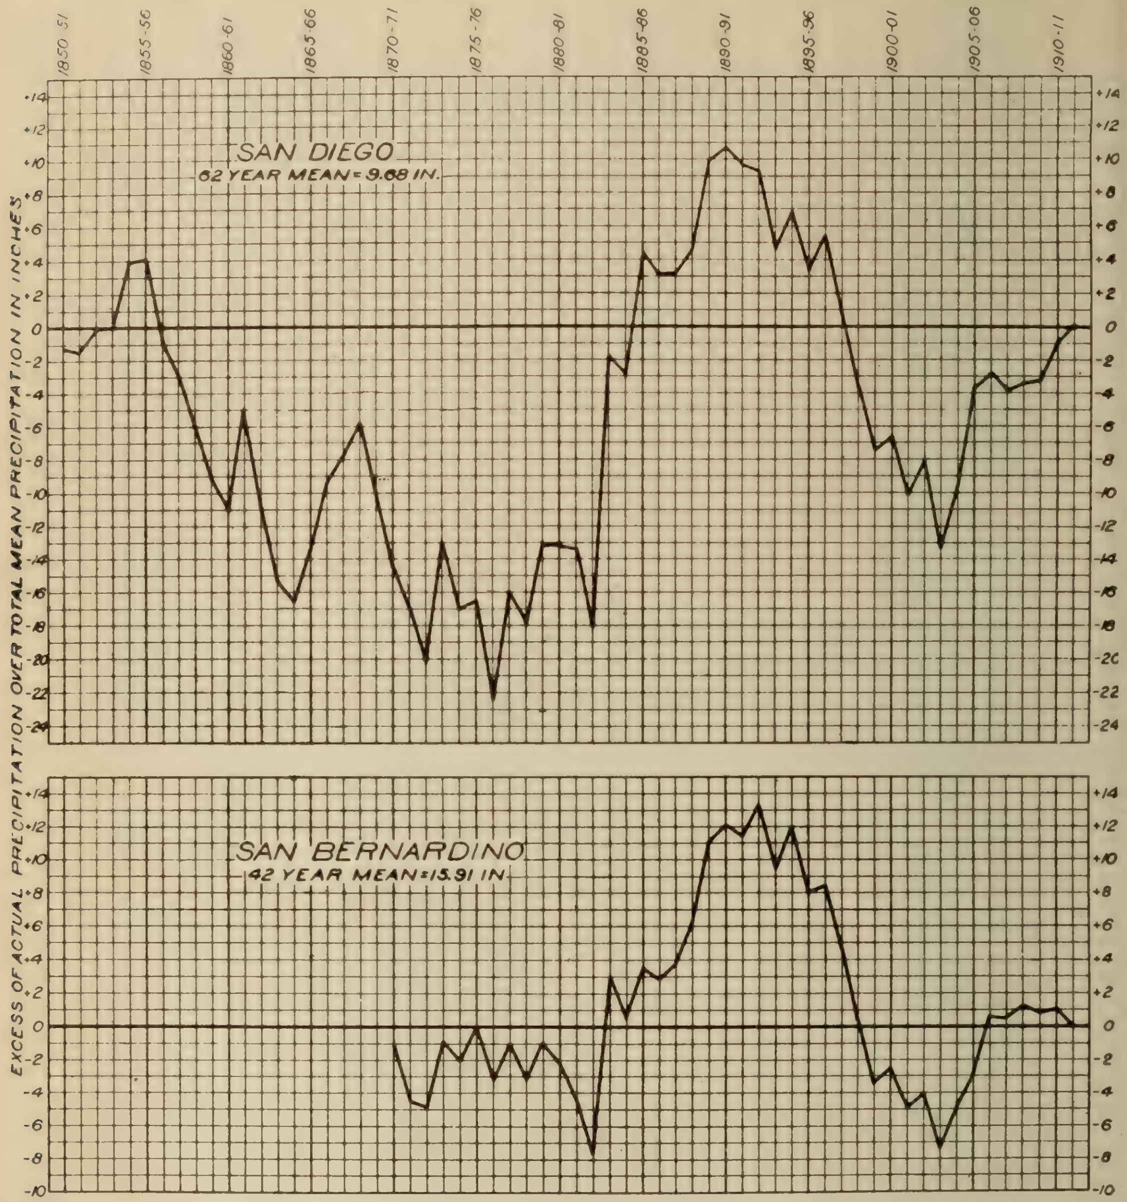

FIGURE-3-RESIDUAL MASS CURVES OF PRECIPITATION FOR TYPICAL SOUTHERN CALIFORNIA STATIONS

Residual mass curves of precipitation have been prepared for two typical stations (Fig. 3). The ordinate of any point on these curves is the difference between the aggregate rainfall from the beginning of the period of record to the date considered, and the aggregate rainfall which would have fallen during the same period if the annual rate was the observed mean. The diagrams show marked agreement in the general tendencies. There is the period of accumulation from the minimum of 1882–83 to the unprecedented maximum of 1891–92, followed by the period of rapid depletion ending in 1903–04. This was followed by a recovery to normal conditions during the period 1905 to 1907, which has been maintained down to present writing. The period of excessive drought 1891–92 to 1903–04 was, therefore, the necessary reaction from a period of several years unprecedented heavy rainfall, combined with a period of ordinary drought such as occurs in southern California at intervals of ten to fifteen years.

[1] Spear, W. E., Study of the Water Supply Sources of Long Island; Report of Commission and Additional Water-Supply of New York City, Appendix 7, 1903, pp. 753-and 817.

The severity of this drought has not been exceeded during any other similar period since 1850. It is therefore to be inferred that acting under natural causes ground water levels in 1892 were at a high stage, in 1904 and 1905 were at a very low level, and that there was a recovery to normal conditions in 1907 or soon thereafter. This conclusion is confirmed by well records.

Run-off.

The relative sizes and positions of the catchment areas tributary to the San Bernardino basin are shown on figure 1. Santa Ana River drains the largest area. It embraces 182 square miles above the government gaging station at Warm Springs Canyon and 208 square miles above the mouth of the canyon. Cajon Basin has an area of about 88 square miles, Lytle Creek 52 square miles, Mill Creek 46 square miles, City Creek 21 square miles, and Plunge Creek 17 square miles. The other canyons are small, none of them exceeding ten square miles in area. The total mountain drainage tributary to San Bernardino Valley is about 480 square miles. The San Timoteo Creek drainage is about 135 square miles. The valley lands above the dike have an area of about 132 square miles. The total area tributary to the drainage outlet of the basin at the Bunker Hill dike is about 750 square miles.

The Santa Ana drainage area discharges more water from its canyon than any of the others, but Mill and Lytle creeks have a greater run-off per square mile. The explanation for this is to be found in the precipitation exposures of the drainage areas. Mill and Lytle creeks both drain mountain faces receiving copious rainfall. The upper Santa Ana drainage, however, is on a high plateau which on the east borders the desert and receives a much smaller precipitation than the lower portion to the west which corresponds with Mill Creek in productiveness of run-off. The small drainage areas west of the Santa Ana reach moderate elevations and probably yield less run-off per square mile than Mill Creek, although their exposure is good. The run-off from Cajon Basin is very small on account of the low elevations, gentle slopes and desert exposure. The yield per square mile of Santa Ana Canyon is probably a good average for the 480 square miles of mountain drainage.[1]

The Santa Ana is the only stream entering the valley upon which regular measurements have been made. The government has maintained a station at Warm Springs Canyon since 1896 for the purpose of observing flood flow and waste. During the irrigation season the river water is all diverted onto agricultural lands near Redlands and Highlands. The published government records include both flood flow and irrigation diversions so that the total run-off is available. There has been a storage reservoir operated in the interest of irrigation on Bear Creek, a tributary of the river, during the whole period of record. The maximum storage capacity has been 26,463 acre-feet up to the present season, when it was increased to 65,000 acre-feet. This partially regulates the monthly flow of the stream, but does not materially affect annual variations in run-off. The total mean seasonable flow of the stream for 16 years (1896–97) to date, is 86 second-feet or a continuous flow of 0.47 second-feet per square mile (Table 13).

The seasonal variations in run-off agree generally with the precipitation (Table 14). There are certain differences which may be noted however. Run-off extremes are much more intense than those of precipitation. A precipitation of 50 per cent of the normal produces a run-off of less than 30 per cent of normal, while precipitation 50 per cent above normal results in run-off 2½ times the normal. A year of precipitation above the average following one or more considerably below is not accompanied by a similar increase in run-off. It is therefore to be expected that ground water levels near stream channels would accurately reflect variations in precipitation, although there would be a lag in the complete response of depleted ground water levels to increased precipitation.

The waters which are available to the Water Conservation Association for spreading over the porous gravels are the surplus flood flow of Santa Ana River and Mill Creek. The volume of flood waste from Santa Ana River can be computed with fair accuracy, but no records of discharge are available for Mill Creek. For the purpose of making an estimate of the flood flow from Mill Creek it has been assumed that the run-off per square mile from the drainage area of 46 square miles is 0.60 second-feet continuous flow. This is fully justified by local knowledge of the two streams as well as the government records for San Gabriel River, which show a mean yield of between 0.60 and 0.70 second-feet per square mile for that stream. On this basis the total run-off of Mill Creek is one third of that of Santa Ana River. The use of water diverted for irrigation is similar for the two streams. The proportion of flood waste is possibly greater from Mill Creek than from Santa Ana River because of absence of storage regulation on the former stream. The use of the same percentages of flood waste to total run-off for Mill Creek as determined for Santa Ana River will therefore give conservative results for flood waste. This was the basis for computations.

*Total run-off Mill Creek assumed 33 per cent of that for Santa Ana River.

The computation of surplus flood flow from Santa Ana River was based on a daily hydrograph of the total flow of the stream at the mouth of the canyon from January 1, 1900, to October 1, 1912. Three typical seasons from this hydrograph are presented on figures 4, 5 and 6, the season of 1906–07 being one of unusually large run-off, 1901–02 considerably below normal, and 1902–03 very slightly below normal (Table 14). These diagrams show strikingly the extreme fluctuations of both annual and monthly flow, which characterize the stream even with the existing storage regulation. The irrigation diversions made by the Redlands and Highland canals at the mouth of Santa Ana Canyon are based on approximate estimates, since the records of the Bear Valley Mutual Water Company were not available. The maximum capacity of the two canals is stated by the manager of the company to be 100 second-feet, but this amount is seldom carried. For purposes of computation it was assumed that from the opening of the irrigation season, which varies from April 1st to May 1st to the first general storm in November or December, the combined diversion would be 80 second-feet, except when the discharge of the river was less than this amount, at which time the full flow would be diverted. During the winter season the combined diversion was assumed to be 20 second-feet. The date of opening of the irrigation season was assumed as April 1st in years of light spring rains, April 15th in years of normal spring rains, and May 1st in wet years. The diversions are indicated on the diagrams. The portion of the area within the total discharge line and above the line of irrigation diversion represents surplus flood flow which passes down the Santa Ana Wash, and is available for water spreading. The amounts in acre-feet were computed for each season and are presented together with the total run-off of the stream and the per cent of surplus in the first part of table 15. Considering the period as a whole, 42 per cent of the run-off of Santa Ana River was surplus flood flow which passed the irrigation canal intakes. The per cent in individual seasons varied from 5 to 71. The average annual amount for the period was 37,200 acre-feet, the minimum 1,500 acre-feet, and the maximum 116,100 acre-feet. Adding to these values the waste from Mill Creek, the average annual amount of water available for water spreading is 49,500 acre-feet, the minimum 2,000 acre-feet, and the maximum 154,400 acre-feet.

The extent to which the existing spreading system has been able to handle the available water is shown by the fact that for the last two years the average amount diverted was about 12,000 acre-feet, or 24 per cent of the average amount available. The limit of the system is the amount which can be diverted in a season like 1906–07. The flood flow period covered about 120 days that season. Eliminating the days when the river water would be too heavily charged with silt to admit into the ditches, there would remain approximately a 100-day actual working season. With an average diversion during this period of 150 second-feet the total amount spread would be 30,000 acre-feet. The minimum annual diversion is the amount available in a season like 1903–04, or 2,000 acre-feet. The system as now laid out and operated is therefore able to handle about 20 per cent of the surplus flood flow in years of excessive run-off, 43 per cent in years of average run-off such as 1907–08, and 100 per cent in years of extreme drought. Although good progress has been made toward conservation of flood waters, yet the larger floods which have great possibilities as sources of water for over-year storage still remain practically untouched. The storage of a greater proportion of such flood water should be the aim of the future work of the association.

Stream percolation.

The limited time available for the investigations made it impossible to obtain field measurements of percolation from natural channels. The importance of having data upon this subject is obvious, since without it no comparison can be made of the relative efficiency of natural and artificial percolation, nor can the volume of flood water be computed, which passes from the San Bernardino Basin to the ocean.

The most complete study of natural stream percolation upon streams of the same general type as those under consideration is that carried on by the Los Angeles aqueduct in Owens Valley, California.[1] Comparative current meter measurements were made at intervals of four to six weeks for eighteen months, on twelve mountain streams. The channel traversed the alluvial slope between mouth of canyon and upper edge of valley floor and varied from three to seven miles in length. The gravels were probably not as open and porous as those of southern

---

[1] Lee, Charles E., Water-Supply Paper No. 294, U. S. Geol. Survey, 1912.

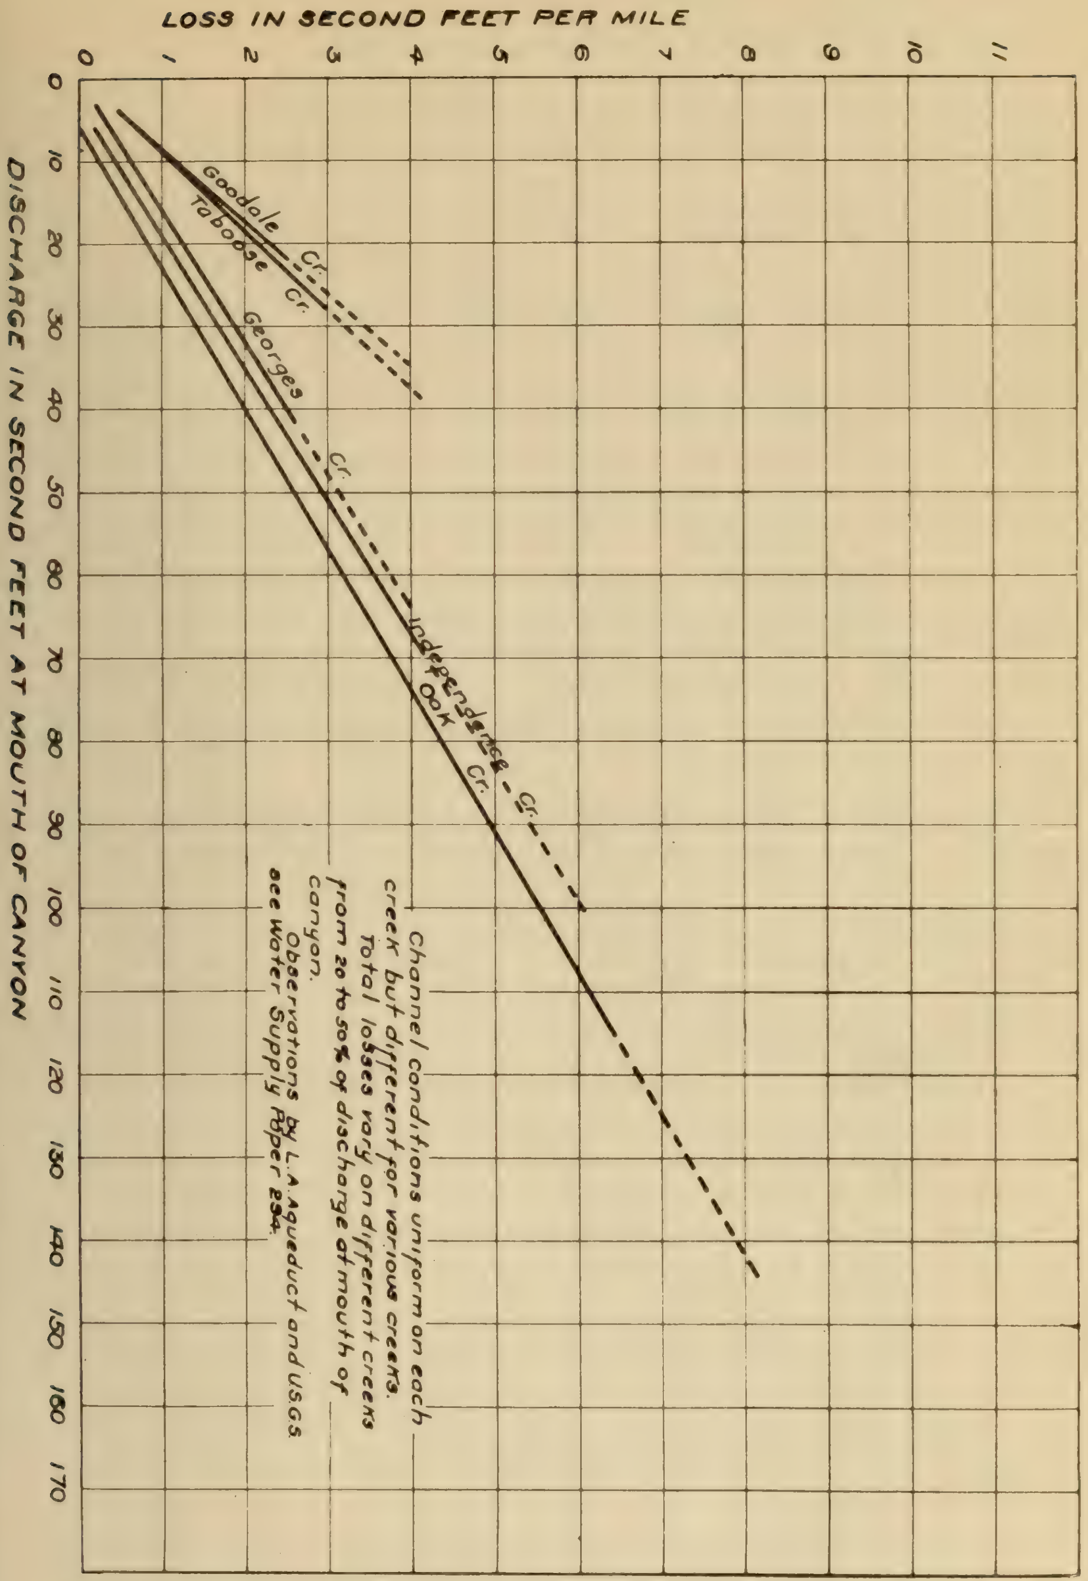

FIG. 7. Stream percolation diagram for Owens Valley creeks.

California and the channels were sufficiently deep and firm to carry flood flows. Careful graphical study of the data showed that for each channel a definite straight line relation existed between total discharge and total percolation loss, or loss per mile of channel. The relations differed for different streams depending upon the formation and the type of channel, but the general law was uniformly observed. Curves for five typical streams are shown on figure 7.

The only available measurements of stream percolation in southern California are those made by the Water Resources Branch of the United States Geological Survey in the spring of 1903.[1] These were made upon twelve streams flowing from the San Gabriel and San Bernardino Mountains during and after the moderate floods of April 16th. There were but two sets of measurements on most of these streams, but straight line curves constructed from these appear reasonable and give results consistent with the Owens Valley data (Fig. 8). The losses per mile of channel are approximately twice those observed in Owens Valley. This is to be expected, however, because of more open gravels traversed by the southern California streams and the tendency of flood water to spread out in a broad sheet. There were observations made on a few of the southern California streams which showed that the rate of loss per mile was greater for that portion of the channel low down on the slope where velocity was checked and the material was predominantly coarse sand. The data was not sufficient to show this variation, however, and in interpreting the diagrams the loss per mile should be recognized as an average.

The results for Santa Ana River are of value in connection with water spreading work. On April 24th a stream of 150 second-feet at the junction of Mill Creek was entirely absorbed before it reached the head of the Gage Canal, a distance of about eight miles. On May 16th a stream of 67 second-feet shrank to 30 second-feet by the time it reached Orange street, and entirely disappeared in the next half mile. The Riverside Trust Company diverted and spread the stream below Orange street bridge, however, so that natural percolation occurred only between Mill Creek junction and Orange street. The curve constructed from this data, although showing slightly less loss per mile than that for Pacoima Creek, is yet parallel to that curve and appears consistent with the other curves and entirely reasonable. It is stated by Mr. J. M. Mylne, engineer for the Riverside Trust Company, that immediately following a flood crest a discharge of 200 second-feet at the junction of Mill Creek will ordinarily disappear before reaching the head of the Gage Canal, but that later on when the stream has cut a narrow channel for itself a discharge of only 100 second-feet would be thus absorbed. Estimates based on an average loss of 150 second-feet would, therefore, be conservative.

A computation of the volume of surplus water absorbed by the gravels and also that passing immediately from the basin was made for Santa Ana River. It was based upon the daily hydrograph of the stream and a maximum percolation loss of 150 second-feet from surplus water following the Santa Ana Wash between the junction of Mill Creek and the head of the Gage Canal (Table 16). An estimate was also made of similar values for Mill Creek. The results indicate that as an average

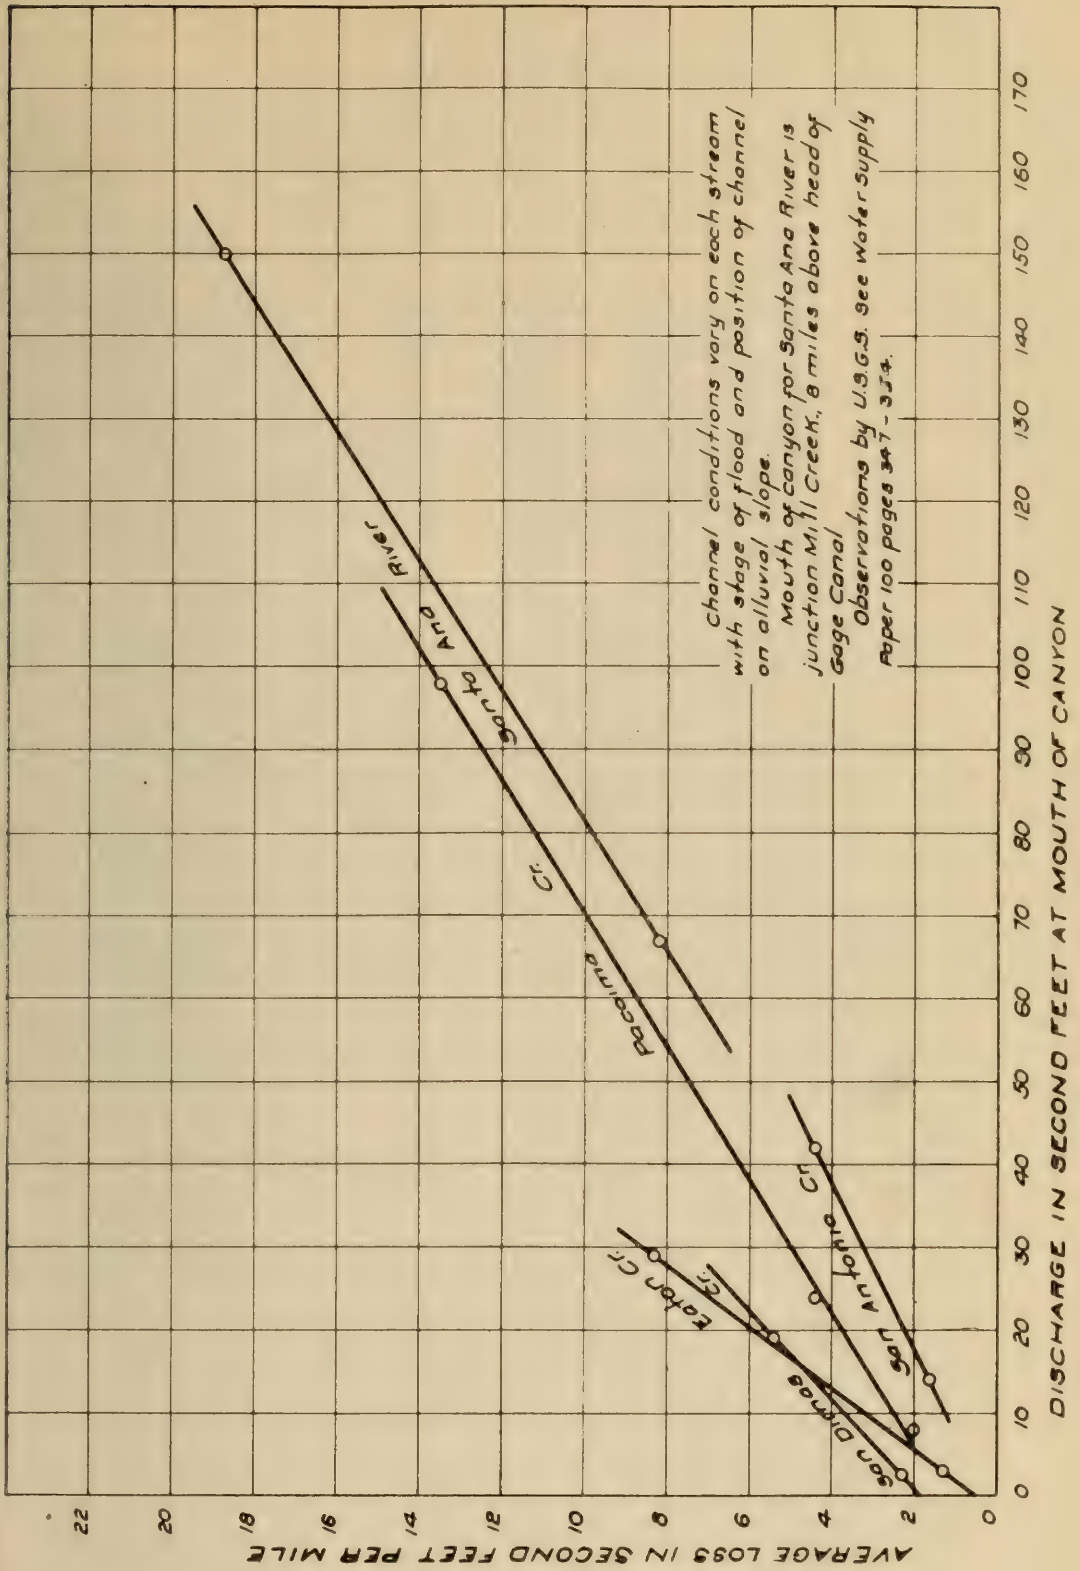

FIG. 8. Stream percolation diagram for southern California streams.

26,500 acre-feet or 54 per cent of combined surplus flood waters from Santa Ana River and Mill Creek cross the Bunker Hill dike immediately, and are lost from the basin. In the wet season 1906–07, 70 per cent was lost and in 1903–04 practically no water escaped from the basin.

1907-08	28,400	20,700	700	3,500	3,500	4,300
1908-09	57,300	32,200	10,900	3,500	10,700	21,600
1909-10	84,600	25,800	37,800	5,200	15,800	53,500
1910-11	74,600	32,900	23,200	----------	18,500	41,700
1911-12	12,000	8,400	600	2,700	300	900
Mean	49,500	20,400	16,800	2,600	9,700	26,500

With the present water spreading system in operation, the average amount lost from the basin will be reduced from 54 to 30 per cent of the combined surplus from the two streams, and the maximum loss from 70 to 50 per cent. In years of drought nearly the whole flow of the stream is absorbed by natural percolation and the only advantage of water spreading would be to get the water into the gravels of the upper slope, and thus store it for use at some future year instead of during the current year. The greatest benefit will result from artificial ground water storage when its primary aim is annual storage regulation. Very effective work has been accomplished already, but still greater possibilities remain.

GROUND WATER FLUCTUATIONS.

Changes in rate of ground water supply corresponding to variation in precipitation and run-off result in vertical movements of free ground water surface, and variation in artesian pressure. The first of these effects can be measured by observing the rise and fall of water in wells. The variation in artesian pressure can best be measured directly by placing pressure gages on capped wells. This, however, has never been done in the San Bernardino Valley. Another method is by determination of the artesian boundary and measurement of the flow from artesian wells. The flow of springs and seepages and the extent of swampy or moist land overlying the artesian basin furnish confirmatory evidence. The volume of ground water returning to the surface and flowing from the basin by way of Santa Ana River and Warm Creek would give still further knowledge. The data presented consist of measurements of free ground water level in wells outside the region of shallow artesian pressure, the artesian boundary at various times, the flow of a few artesian wells, and general information regarding springs and swamp conditions.

Ground water levels.

The most complete data regarding ground water levels in San Bernardino Valley are the measurements of depth to water made by the United States Geological Survey in a series of about 75 wells in San Bernardino and Redlands quadrangles. These wells were selected by Mendenhall[1] in 1904 from among those measured by J. B. Lippincott[2] in 1900. and were observed under the former's direction at intervals of a year or two until 1909. They were observed again in 1912 for the purposes of this study (Tables 17 and 18). Observations were made during the latter part of October each year when ground water levels are the lowest and pumping has practically ceased (Table 19). The wells are distributed throughout the basin and thus eliminate the possibility of drawing mistaken conclusions from local conditions (Plate I).

Observations by Riverside Water Company.

[1] Top of casing to water surface.

[2] Top of lagging to water surface.

[3] Top of blocks to water surface.

[4] Pumping.

[5] Windmill pumping.

Well 337 on June 9, 1908, 33.60.

Meacham windmill well on June 9, 1908, 34.35.

Many of these wells are 7-inch casing windmill wells of moderate depth. Such wells are more reliable for making observations since they are not as liable to experience the wide artificial fluctuation which occur in deep pumped or artesian wells. They are slow to register ground water fluctuations when situated far from some stream channel which is a source of percolating water, but they no less surely experience these fluctations. These conditions are well shown from monthly observations of ground water level made by the Riverside Water Company during the last three years in four wells east of San Bernardino, and one well near Redlands Junction (Table 19 and Fig. 9). Well 57 in the Redlands quadrangle and the Barton and Meacham domestic well are shallow. Well 289 Redlands quadrangle is a deep casing well equipped with centrifugal pump. Well 337 San Bernardino quadrangle is an old artesian well reported to be 325 feet deep, which reaches one or more of the artesian strata drawn upon by the large artesian wells along Base Line, Ninth and Sixth streets, east of San Bernardino. The shallow wells have a range of annual fluctuation of from two to six feet with the lowest level in September or October. The pumped well has a fluctuation of from 10 to 25 feet with a minimum just preceding the first general winter storm. The old artesian well has an annual fluctuation of from 25 to 30 feet. The record on this well is of particular value since it shows the marked effect produced upon artesian pressure by opening a number of the large flowing wells. The result is shown in this well by an immediate lowering in water levels of from 15 to 20 feet. The owner of the well states that he has observed the level drop in this manner within an hour of the opening of large wells along Sixth street. Partial recovery at the time flowing wells are capped is equally rapid, but full recovery is delayed until the basin is recharged from winter rains. Similar conditions are reported in many other wells around the rim of the artesian area. These records show the greater reliability of wells which do not reach artesian strata for determinating annual tendencies in ground water fluctuations.

The government records in Tables 17 and 18 show that ground water levels fell materially throughout the basin from 1900 to 1904. Wells situated away from stream channels continued to fall until 1906, but those near stream channels showed partial recovery in that year. In 1907 all observed wells showed recovery. The observations of 1909 showed still further recovery, and in 1912 the levels in many wells were higher than in 1900. The average rise of ground water levels throughout the basin from the lowest levels of 1904 or 1906 to the level of 1912, is 30 feet. Some of the most marked recoveries were in the region north and northwest of San Bernardino; for example, the rise in Well 354 was 42 feet and in Well 389, 50 feet. This region on account of its relative position can not have received a greater benefit from water spreading than any other, and it is doubtful if it benefits even by increased deep artesian pressure. The total amount of water spread by the association during the last four seasons has not exceeded 30,000 acre-feet, a volume of water which would represent about 90,000 acre-feet of saturated gravels, or three feet depth over 47 square miles. Within that four-year period water levels had risen at least 15 feet over a larger area and had commenced to rise rapidly even before water spreading was practiced extensively. The conclusion is that water spreading has had comparatively little to do with the general recovery of ground water levels in the San Bernardino Valley.

A suggestion as to the most important cause of these marked fluctuations of ground water surface is to be found in their similarity to the broad rainfall fluctuations, as shown by the residual mass curve for San Bernardino (Fig. 3). This curve as previously explained should exhibit the same tendencies as natural ground water fluctuations in the region for which it is prepared. A comparison of the data of Tables 17 and 18 and Fig. 3 show a marked similarity in general tendencies. The broad fluctuations of ground water surface during the last twelve years are, therefore, consistent with rainfall and run-off variations during the same period.

Artesian Conditions.

The only available series of measurements of artesian flow covering the period under investigation are those of the Riverside Water Company. These are not complete, nor do they represent in all cases the flow of a well or group of wells as influenced solely by natural conditions. There have been selected from the company's records four sets of measurements which are fairly complete and register natural tendencies most accurately. These are the McCrary tract wells, a group on Warm Creek, near base line 1¼ miles west of Harlem Springs; the Cooley Tract well on Warm Creek, between Ninth and Sixth streets; the Heap well on Ninth street just west of Warm Creek, and the Katz-Walkinshaw wells west of Warm Creek at First and D streets, San Bernardino. The McCrary Tract wells are situated just west of the buried hills, previously described along the line of the Harlem Springs defile, and pressures here should register very quickly any changes in rate of ground water supply. The Cooley and Heap wells are situated 1½ miles further west and their fluctuations might be expected to lag a little. The Katz-Walkinshaw wells are still further west, but hardly far enough to be directly affected by Lytle Creek, and hence would have greater lag than the Cooley and Heap wells. The records confirm these probabilities (Table 20 and Fig. 10). The McCrary well records show that artesian flow decreased steadily from year to year from 1898 to 1904, inclusive, with slight recoveries in the spring of 1901 and 1903. Beginning with 1905 there was a marked recovery culminating in 1907 or 1908. Following this was a period of comparative stability with a slight gain in 1911, and falling off in 1912. The same general fluctuations are shown by the other artesian well records, but with less intensity. Following the year 1904 there was a lag of one year in the Heap and Cooley well, and two years in the Katz-Walkinshaw wells before the effect of increased rainfall of 1905 and 1906 was felt.

These fluctuations correspond in their general tendencies with the fluctuations observed for free ground water surface throughout the basin (Tables 17 and 18). This is to be expected, since artesian flow is controlled by artesian pressure and artesian pressure controlled by the level of free ground water surface surrounding the artesian basin. Hence water spreading has had no more to do with increased artesian

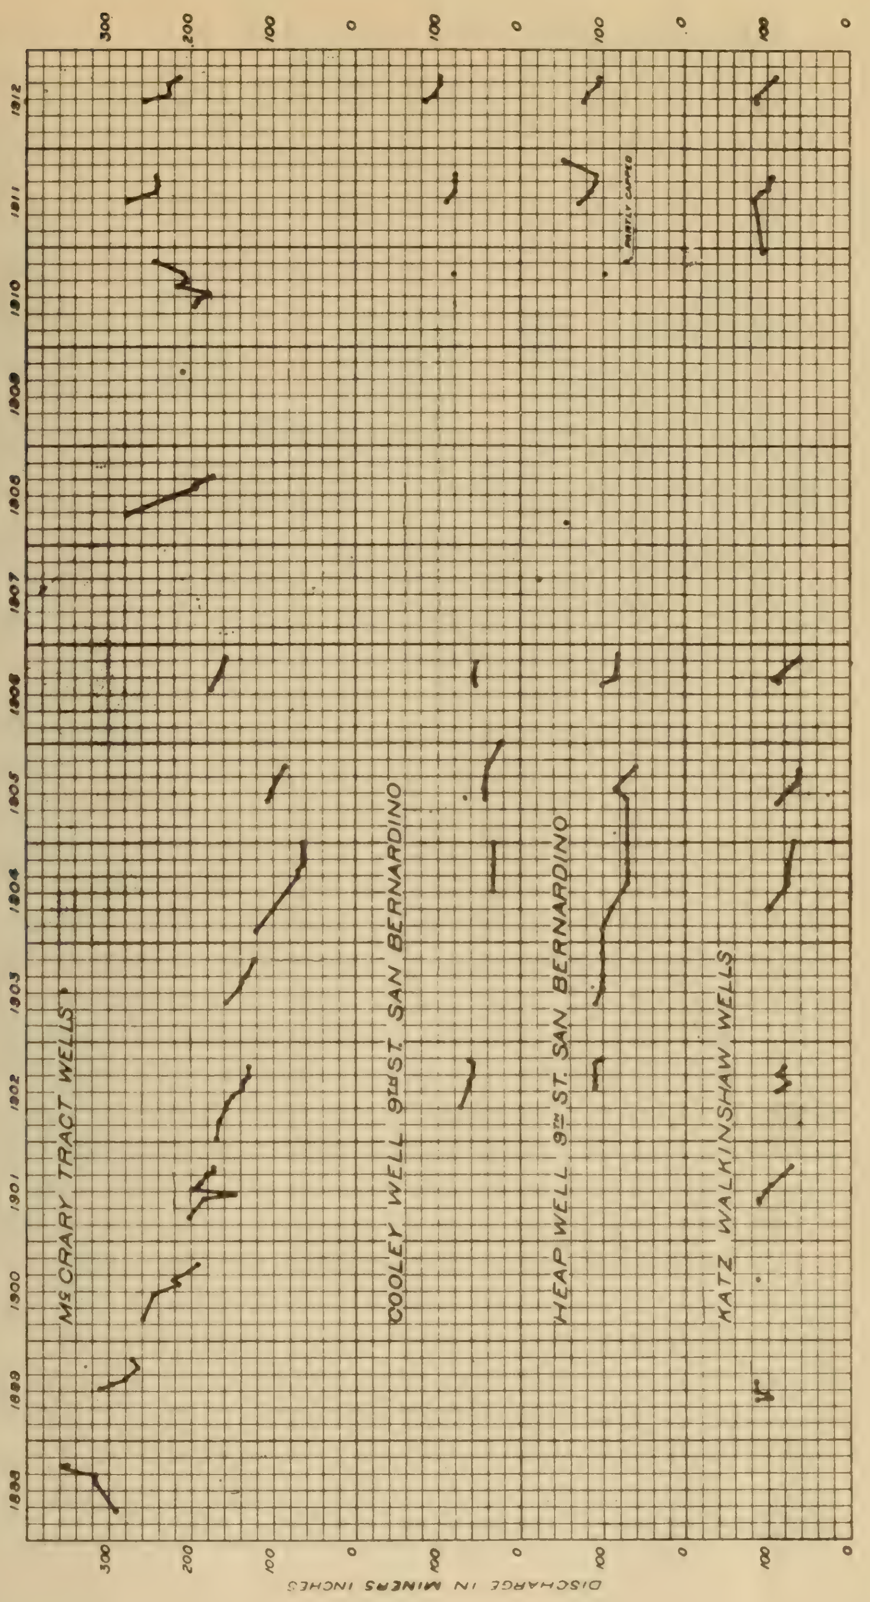

FIGURE-10-DISCHARGE OF TYPICAL ARTESIAN WELLS IN SAN BERNARDINO VALLEY

flows in these wells since 1904 than with the recovery of free ground water levels. Since observations on ground water levels showed consistent and similar fluctuation throughout the basin, there is every reason to believe that artesian flow throughout the basin would follow the same variation as has been observed in these four groups of wells. The McCrary wells are so located that they could not be directly benefited by the water spreading as carried on, yet they exhibited marked recovery even before water spreading was attempted on the upper Santa Ana fan. There is no possible conclusion but that ground water recovery has been in large part the result of some other cause than water spreading.

The systematic and thorough capping of flowing wells throughout the basin which has been accomplished during the last few years may be partially responsible for the remarkable recovery. Prior to the dry years the importance of conserving artesian water was not realized and many of the large wells were allowed to flow summer and winter, whether needed or not. By the year 1904 most of the big irrigation company wells were equipped with caps which were closed down during the winter. Through local agitation in southern California a law was passed by the California State Legislature in 1907 and amended in 1909, declaring artesian wells a public nuisance when not equipped with proper mechanical devices with which to arrest their flow, and the waste of artesian water was declared misdemeanor. The efficient administration of this law was brought about in the San Bernardino Valley through the appointment of an officer by the district attorney of San Bernardino County, whose duty is to inspect all flowing wells and keep the district attorney informed regarding cases of failure to obey the law. As a result of these efforts practically all private, as well as company, wells have been closed since 1909, and unnecessary losses from the basin reduced to a minimum. This work has assisted in conserving the natural increase in the rate of recharge of the basin, and is of great public benefit.

However, the most important cause of ground water recovery is to be found in the increase of natural ground water supply as exhibited by precipitation. A careful comparison of the flow of the McCrary wells and the residual mass curve of precipitation at San Bernardino shows a remarkable agreement even to the details (Figs. 3 and 10). The observed flow of 1898 has never been exceeded since nor has the aggregate returned to the high level of 1898. Both have returned to conditions of 1899, however. The decrease in flow continued from 1898 to 1904, inclusive, with slight spring recoveries in 1901 and 1903, just as exhibited by the mass curve. Marked recovery commenced in 1905 and continued to 1907, following which was a period of little fluctuation to date, with the slight increase in 1911, and falling off in 1912. A more perfect agreement of related variables could hardly be expected. The dependence of ground water fluctuations upon precipitation is thus established beyond a doubt.

The investigation of artesian boundaries and swamp conditions still further corroborate these conclusions. The limit of the area underlaid by artesian pressure as indicated by existing wells has been determined several times in past years, and was again determined for the purpose of these investigations. The approximate original artesian limit, the limit in 1900 and again in 1904, has been indicated by Mendenhall

(Plate I).[1] The original limit represented conditions as they were at their maximum in the late eighties. The limit of 1900 was very much smaller, the area having been reduced by about 50 per cent. The limit of 1904 was still further shrunken. From all information at hand the limit of 1904 was the minimum reached as a result of the years of drought. Since 1904 there has been a gradual expansion of the area. In the spring of 1912, following the storms of March and early April and preceding the opening of large flowing wells in May, the boundary was found to have advanced on all sides of the basin, from what it was in 1904, by distances of from one fourth to one and one fourth miles (Plate I). Although the advance was greatest along the east border of the basin where the slope is flat, yet the recovery is equally great on the north where the slope is steeper. Many wells of moderate depth near and in San Bernardino which originally flowed, but had not done so for twelve or fifteen years, commenced to flow again about the year 1909 and have continued to do so since with increasing pressure. Hence, the limits of artesian flow have exhibited the same general tendencies as have precipitation, ground water levels and artesian flow from deep wells.

In connction with the study of artesian limits a very interesting fact has been noted. Although this remarkable expansion of the artesian area was noted in late April of 1912, yet in May, when the large artesian wells operated by the Riverside Water Company and the Gage Canal were opened, the artesian pressures throughout the basin were so reduced that the flow ceased from many of the wells outside of the minimum area of 1904. The opening of the Riverside Water Company's wells was also accompanied by the sudden drop of water level already noted for Well 337, San Bernardino quadrangle (Table 19). The boundary was determined again on October 9, 1912, four days after the closing of many Riverside Water Company wells as a result of the rain storm of October 2d and 3d. The artesian limit on October 1st was practically that determined by Mendenhall in 1904, and represented conditions following the summer irrigation period with all wells still open which had been uncapped during the summer. On October 4th and 5th and thereafter, immediately following the closing of the Riverside Water Company's wells, wells outside the minimum area began to flow or rise rapidly in the casing and by October 9th the artesian limit had advanced well out toward the limit of late April. The storm of October 2d and 3d followed a long dry summer and produced no appreciable run-off from the mountains. It could not, therefore, be ascribed as the cause of the rapid expansion of the artesian limit. The only explanation is that the pressure relief afforded by many large flowing wells ceased and pressure throughout the basin returned to that of the spring except as reduced by the water taken from the basin during the summer. That this condition occurs each year is shown by the common statement of farmers within the zone of expanded artesian pressure around the 1904 limit, that their wells flow in the winter and spring time, but cease just as soon as the deep flowing wells are uncapped. The condition is interesting in connection with the Coastal Plain artesian basins where ground water levels have not recovered materially since 1904 and where attempts to close artesian wells during the winter months have not been successful. The basins are not similar as regards the alluvial material and relation of natural ground water supply to artificial draft, but yet the conclusion is justified that the capping of artesian wells when not in use is a very important step toward conservation of ground water resources.

---

[1] Mendenhall, W. C., Water-Supply Paper No. 142, U. S. Geol. Survey, 1905. Plate VII.

Returning again to the San Bernardino Valley artesian conditions, there is still further evidence regarding the relation of artesian pressure and of accumulated rainfall excess or deficiency. A very important ground water outlet is evaporation from lands kept moist from below by artesian pressure forcing water up through the pores of comparatively impervious overlying clays, or through larger natural openings. Where the soil is kept quite wet there is a swamp condition with rank vegetation. The evaporation from such a surface is greater than that from a free water surface. The extreme fluctuations of artesian pressure are accompanied by corresponding changes in the intensity of such surface conditions. It is a matter of common knowledge that the lands north and east of San Bernardino, which were very swampy about 1890, were completely drained during the drought ending in 1904, and as a result have been put under a very profitable cultivation. The ranch of Mrs. A. Tompkins, between Seventh and Fifth streets, west of Mount Vernon avenue, was thus drained. The lower portion of this ranch was formerly an impassable swamp in which cattle bogged down and from which a stream of seepage water flowed. The swamp disappeared during the dry period and since then has been continuously farmed. About the year 1910, however, the ground water level began to rise beneath this land and swampy conditions reëstablish themselves. In the winter of 1910–11 the stream of seepage water reappeared. If artesian pressures continue to increase this land will eventually return to its former condition. Other lands are experiencing a similar return to swamp conditions.

Judging by such evidence as this the depleted ground water conditions culminating in 1904 were not entirely due to the great increase in ground water development, which marked the immediately preceding years. It is reported by old residents that for a few years prior to the wet winter of 1883–84 lands northwest, north and east of San Bernardino along Base Line to Harlem Springs were quite as dry as in 1904, but that following that and the subsequent wet seasons, the swamp area expanded rapidly to the extreme of the late eighties. The precipitation mass curve for San Diego and San Bernardino (Fig. 3) both indicate that depleted ground water levels existed prior to the season 1883–84, which were fully as low as in 1904. Hence, there is reason to believe that depleted ground water conditions, nearly, if not fully as extreme as those of 1904, have occurred in past years and that the basin was fully recharged by natural agencies alone.

It can be said that there is no evidence to be found in a study of available data regarding ground water levels, artesian pressure, or surface conditions in the San Bernardino basin which shows appreciably the effect of water spreading on the Santa Ana fan, or which can not be explained as the result of natural causes. If the record of ground water fluctuations in the immediate vicinity of the spreading-grounds were available, however, there is no doubt but that they would show very appreciably the effect of water spreading by the unusually shallow depth of the local ground water plane. The area of the whole basin is so great and the movement of ground water so slow that the general effect throughout the basin is still inappreciable and will not be recognizable until a series of dry years occurs.

GROUND WATER FLUCTUATIONS IN OTHER BASINS.

The ground water situation in most of the basins of southern California is so complicated by artificial conditions that investigation for the purpose of comparison with the San Bernardino basin would lead to no conclusions of value. Water spreading has been practiced in San Jacinto Valley, in the lower San Gabriel Valley, along the upper border of the Coastal Plain near Orange and on the alluvial fans of San Antonio and San Dimas creeks. There has been very little attempt to cap flowing wells when not in use in the Coastal Plain artesian area. Furthermore, in most of the southern California ground water basins, except San Bernardino, the artificial draft bears an excessive ratio to the rate of recharge. The San Fernando Valley is the only one which during the last fifteen years has not experienced any of these artificial interferences with natural ground water conditions.

This valley is a typical ground water basin fed largely by percolation from streams draining the San Gabriel Mountains. The formation of the material filling the valley is not favorable for artesian flow but the development of ground water within the valley by pumping is entirely practical. The movement of percolating waters is through the porous gravels toward the lowest depression of the valley where the ground water plane is close to the surface. The natural outlet is by evaporation from the cienaga thus formed, and by the escape of ground water through springs and seepage into the channel of Los Angeles River, which flows out of the valley by way of the ''Narrows'' south of Burbank. This stream is the overflow from a great storage reservoir and as is to be expected is very uniform in flow. The city of Los Angeles depends upon the flow of the river for its municipal supply in conjunction with pumping plants and infiltration galleries along the channel. The city has kept a record of the discharge of the stream exclusive of flood flow since 1898,[1] which is reproduced as Figure 11.

---

[1] Mulholland, William, Eleventh Annual Report of the Board of Public Service Commissioners of City of Los Angeles, June 30, 1912.

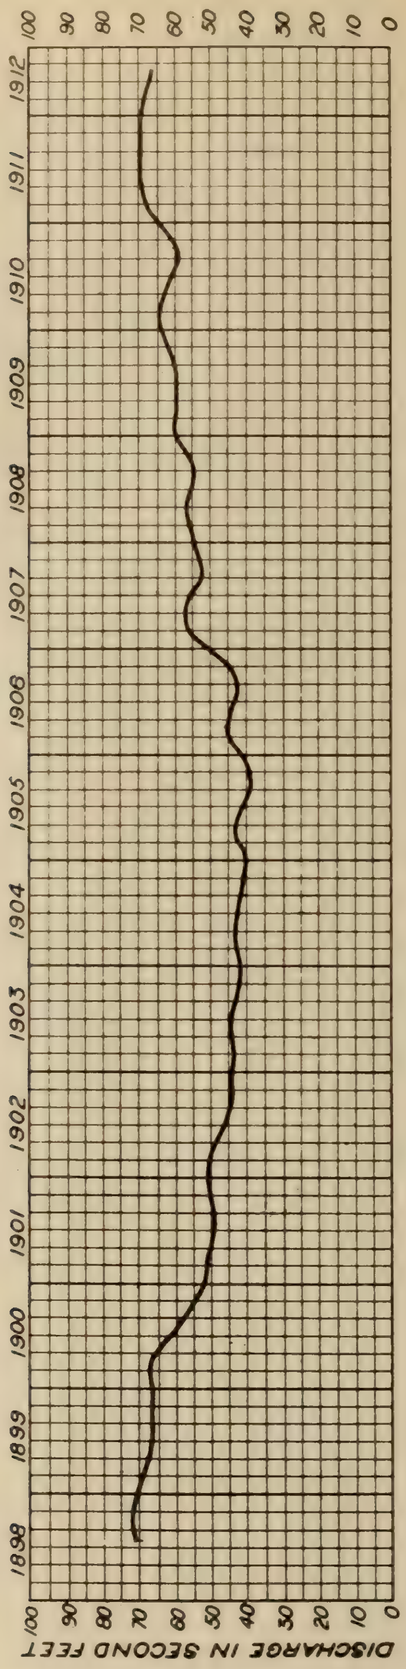

FIGURE-11-DISCHARGE OF LOS ANGELES RIVER EXCLUSIVE OF FLOOD FLOW FROM 1898 TO 1912

There is a striking agreement in the broad fluctuation in flow of Los Angeles River, the fluctuation of ground water level and artesian flow in San Bernardino Valley, and the residual mass curves of precipitation at San Diego and San Bernardino (Fig. 3). The similar curve for Los Angeles, although not presented in this paper, agrees closely with that at San Bernardino as inspection of Fig. 2 will show. A careful comparison of the detail of the mass curves and flow of Los Angeles River show a close similarity, although there is a tendency for the annual precipitation differences to lag one year before appearing in the river flow. This is to be expected, however, because of the slow movement of ground waters from the upper alluvial slopes to the region of outlet. The variation in flow of Los Angeles River, exclusive of flood flow, is controlled solely by ground water fluctuations. It can, therefore, be said that the San Fernando basin, whose ground water fluctuations are the result of natural causes alone, is subject to similar annual rainfall variations with San Bernardino basin and exhibits similar ground water fluctuations. This still further supports the conclusion that water spreading in San Bernardino Valley has filled a minor place in bringing about a recovery in ground water supply.

CONCLUSIONS.

1. The control of surplus flood water of Santa Ana River and Mill Creek by artificially increasing percolation therefrom into the porous gravels of the alluvial slope for the purpose of increasing the ground water supply of San Bernardino Valley is a commercially practical work of great public benefit, provided it is carried on so as to bring about over-year storage regulation.

2. The work as carried on by the Water Conservation Association is accomplishing the storage of approximately 12,000 acre-feet per annum at an annual cost of 15 cents per acre-foot, or 30 cents per acre irrigated therefrom. The immediate loss of flood water from the basin is being reduced from 54 per cent of the surplus flood flow as formerly occurred to 30 per cent.

3. The work of water spreading has not yet been carried on long enough, nor on a large enough scale, to have appreciably affected general ground water conditions by raising the water plane or increasing artesian pressures. The observed recovery in the San Bernardino Valley is primarily the result of a period of several years during which annual precipitation was above normal, following a period of protracted drought.

4. The capping of artesian wells when not in use is an expensive and practical way of conserving ground water supplies, which should be systematically and thoroughly practiced in every ground water basin where the ratio of artificial draft to natural outflow is large.

5. The subterranean storage of surplus flood waters by artificial methods for the purpose of increasing over-year storage, can, and should be, carried on more extensively in the future so as to hold back a greater proportion of the large floods which occur on Santa Ana River and Mill Creek, as well as other streams in the San Bernardino Valley.

GROUND WATER RESOURCES OF INDIAN WELLS VALLEY.

By CHARLES H. LEE.

The existing high price of land in the settled portion of California has led many prospective homeseekers and farmers to take up unappropriated government lands under the provisions of the Desert-Land and Homestead Acts. Most of the unoccupied government land which can be cultivated lies in the desert portions of the State, principally in that great area of southeastern California known as the Mojave and Colorado deserts and the Death Valley region. The extreme aridity of this area makes farming impossible without irrigation. There are only three streams, Owens, Mojave, and Amargosa rivers, originating from precipitation on the tributary mountain slopes, which are of sufficient size to flow from their canyons without sinking immediately into the desert sands. These rivers are available as sources of irrigation supply to very limited portions of the whole desert area and agricultural lands most favorably situated for receiving such waters have long ago passed into private possession. The only available source of supply for most of the desert lands upon which entries have been made in recent years is water which may be drawn from the porous gravels underlying such lands. The supply thus obtainable will prove sufficient to irrigate a small portion of the agricultural lands in each valley, but it is far from being enough to irrigate all such lands. The average settler has no conception of how to estimate the volume of ground water which can be pumped without lowering the water level beyond practical pumping limits. The wonderful success with which ground water is being developed in the valleys of southern California has led many people to believe that the desert ground water supplies are equally large. Many families are building homes on the desert, putting down wells, installing pumps, and preparing land for irrigation with the firm belief that their efforts to reclaim the desert will be crowned with success. The purpose of this paper is to describe the ground water conditions in Indian Wells Valley, a typical desert valley which is being rapidly settled, and show how much water can be developed by pumping and how much land irrigated. The ground water conditions of nearly all the desert valleys of southeastern California are exactly similar, although the amount of water which can be pumped differs according to local conditions in each valley. The discussion and data regarding the ground water supply of this valley will be a valuable guide to those interested in other valleys of the desert region.

The investigations were carried on by the Conservation Commission of the State of California. The writer was in charge of the planning and execution of the work. Mr. W. H. Spear gathered the well data and made such field surveys as were necessary. The settlers and local well drillers furnished much valuable information and rendered every possible assistance. The field work was performed during September and early October, 1912.

TOPOGRAPHY AND GEOLOGY.

Indian Wells Valley, formerly called Salt Wells, lies mostly in the northeastern corner of Kern County (Plate I). The northern part extends into Inyo County and the eastern border is in San Bernardino County. Townships 25 and 26 south, range 39 east, Mount Diablo meridan, and townships 25 and 26 south, range 40 east, lie wholly within the valley. Considerable portions of townships 25, 26 and 27 south, range 38 east, and township 27 south, range 39 east, are also within its borders.

The old stage route from Mojave to Keeler lies along the western border, as do also the well-known desert springs at Freeman and Indian Wells. The Los Angeles Aqueduct, bringing water from Owens Valley to Los Angeles, has been built through the mountains to the west from Little Lake to Indian Wells. Near the latter point it passes out into the valley and extends southward to Red Rock Summit. The railroad recently constructed by the Southern Pacific Company from Mojave to Owens Valley passes through the Indian Wells Valley and its advent has greatly stimulated settlement. Two small towns have been laid out near the railroad at Inyokern and Brown, and serve as centers for the southern and northern sections of the valley. The area of land within the valley which has been recently filed on at the United States Land Office at Independence, California, is about 130 sections. It comprises the two easterly tiers of sections in townships 25 and 26 south, range 38 east; townships 25 and 26 south, range 39 east; the two westerly tiers of sections in township 25 south, range 40 east; and all except the two easterly tiers of sections in township 26 south, range 40 east. (Plate II.) About one fifth of this area has been cleared of desert brush. Improvements are to be found on about one fourth of the filings and consist of homestead cabins and outbuildings, fencing, drilled wells and, in a few instances, power pumps. There have been drilled, altogether, more than one hundred "stovepipe" casing wells, varying from 100 to 750 feet in depth.

The length of the valley-floor from north to south is about 15 miles and in its greatest width 16 miles. The area of the valley floor, not including the high mesa extending to the southeast is about 213 square miles. Of this area possibly 130 square miles, or 83,000 acres, could be cultivated and crops raised by irrigation if sufficient water were available. The general slope of the central and northern portion is to the east and southeast toward the low depression known as China Dry Lake. The southern part of the valley slopes northeast toward this lakebed. Elevations vary from 3,000 feet above sea level along the base of the Sierra Nevada Mountains, on the west to 2,120 feet in the

lowest depression of the dry lake bottom. The slope of the ground is steepest near the mountains and decreases toward the lake bottom. The drop per mile near Brown is slightly more than 50 feet. A few miles east of Brown it is 20 feet per mile and continues thus nearly to the lake bottom. At Inyokern the drop is about 40 feet per mile and decreases to about 30 feet per mile at a point four miles from the lake bottom. Beyond this point to and across the lake bottom the surface is almost level. The lake bottom varies from 2,140 feet at the upper end to 2,120 at the south.

PLATE III.—Old shore line of China Lake near outlet.

The most interesting feature of the valley topography is this dry lake

(Plate II). It occupies the lowest depression of the valley towar which all drainage lines are pointed and is a typical playa lake of th desert, known in different localities as "borax lakes," "salt lakes," o "alkali marshes." (Plate IV A.) It is the evaporating pan fo drainage from the whole valley and its tributary mountains. The lak bottom is a flat expanse of silt and clay. Over the north arm of th lake this is wet and so soft that cattle bog down in it, even in midsumme The southern portion dries out during the summer to a depth of 3 or inches, forming a hard crust beneath which the clay is very moist. I the winter the whole lake bottom is soft and boggy. Surplus floo water collects in it during wet winters but soon evaporates. Whe looking at the lake bottom from a distance, mirage always gives th impression of a great expanse of water, particularly in midsumme In certain portions of the lake bottom and all around the rim an alka crust is continually forming (Plate III). This sometimes has a thicknes of half an inch. The growth of the crystals causes lateral pressure i the crust and as a result it heaves up in ridges and mounds, an eventually cracks and breaks. Walking on it is similar to walking o a thin frozen snow crust except that the moist soil beneath gives bette support than soft snow. The crust contains various soluble alkali an saline salts and a small amount of borax. When the alkali is not to strong the moist soils around the rim support a sparse growth of sa grass. The source of the soluble salts forming this crust is to be foun in the water which collects in the lake depression from all parts o the valley and precipitates its dissolved mineral content in the proces of evaporation. There being no outlet from the basin, these salt accumulate indefinitely.

The valley is completely surrounded by mountains. On the wes it is bordered by the Sierra Nevada Mountains, whose crest reache an elevation of nearly 8,000 feet. The width of the slope tributar to the valley is from three to six miles and is cut by deep canyons. Th formation is granite. To the north is an extension of the Cos Mountains and the Argus Range, both of which are parallel with th Sierra Nevada. Between the Coso Mountains and the latter is a narro defile known as Little Lake Canyon which opens out into Rose Spring Valley. The surface drainage of this region as far north as Haiwe is tributary to Indian Wells Valley. The Rose Springs Valley is reall an extension of Owens Valley and in former geologic times the Owen Lake overflowed to the south and found an outlet through the valley an Little Lake Canyon to Indian Wells Valley. The old channel of th river appears at several places near Little Lake and is remarkably we preserved in the lava rock. There are two small basins between th Coso and Argus ranges tributary to Indian Wells Valley. The uppe one, known as Coso Basin, contains the Coso Hot Springs, which ar residuals of the former volcanic activity of the region. The lower on is really an arm of Indian Wells Valley which has been cut off by a lav flow from the northwest. There is a dry lake bottom in its lowes depression. The Argus Range presents a steep slope toward thi lower basin and the Indian Wells Valley from the east. It reaches elevations between 6,000 and 7,000 feet and is cut with deep canyons. The Coso Mountains are much lower and less steep. Both the ranges show the results of volcanic activity in the form of cinder cones and lava flows. The core of both ranges is granite overlaid with highly metamorphosed slates and schists. The Argus Range shrinks to a low ridge of granite hills opposite the center of Indian Wells Valley. The China Lake of former geologic times was fed by the overflow from Owens Lake and found its outlet to Searles Lake through this ridge by way of a narrow gorge cut into the granite. Although partially filled with sand, the gorge is still remarkably well preserved. The level of the outlet is about 40 feet above the present lake bottom. The old shore line of China Lake is as well preserved as the gorge and can be traced along the base of the hills for several miles (Plate III). The Rademacher Hills close the valley on the south. This is a short range of about 20 miles in length, reaching moderate elevations. Between the north end of the range and the Sierra Nevada is a high mesa which at the west falls off rapidly into the Red Rock Canyon.

The total area tributary to China Dry Lake is about 1,050 square miles (Table 1). Of this, 770 square miles is in Indian Wells Valley and the tributary mountain slopes, 200 square miles in Rose Springs Valley, and 80 square miles in the Coso Basin. The area of the mountain slopes tributary to Indian Wells Valley is 360 square miles and the valley floor and mesa 410 square miles.

The present floor of the Indian Wells Valley is formed by the alluvial material which has been carried from the mountain canyons by flowing streams and deposited in the open valley. The depth of this filling varies in different parts of the valley, depending upon the elevation of the impervious floor. The mesa formation at the southwest end of the valley dips to the northeast and is reported by well drillers to lie beneath the modern gravels. In a well 3½ miles northeast of Inyokern it is found at a depth of 300 feet and described as a very tough impenetrable blue clay. In another well six miles northeast of Inyokern the same formation was encountered at 230 feet below the surface. At Terese, 4½ miles southwest of Inyokern on the railroad, a prospect oil well was drilled which encountered this clay or shale at a moderate depth and is reported not to have passed through it at a depth of 1,935 feet. The wells in other parts of the valley do not encounter any underlying impervious formation at depths of from 200 to 300 feet. It is probable that the valley-fill nowhere exceeds 300 feet in depth, and over most of its area does not exceed 250 feet.

The character of this alluvial filling as shown by well logs is typical of similar valleys throughout southern California. There is from 50 to 150 feet of coarse gravel overlaid by finer gravel, sand and top soil. Beneath this gravel is impervious clay from 10 to 50 feet thick. Below this to the impervious floor of the basin are alternating layers of coarse gravel and clay. In the northern portion of the valley considerable water worn lava rock is brought up during drilling operations indicating the extent to which Owens River contributed to the work of transporting and depositing material. About two miles northeast of Brown there still remains a deep channel lined with large lava boulders which appears to have been the channel of Owens River before it ceased to flow through Indian Wells Valley. The most active streams were those from the Sierra Nevada Mountains as indicated by the great accumulation of alluvial débris along the base of this range.

In conclusion it may be said that the topographic and geologic conditions of the Indian Wells Valley correspond with those of the recognized ground water basins of California.[1]

PRECIPITATION AND STREAM FLOW.

There are no precipitation records available within the Indian Wells Valley or the tributary drainage area. The nearest records applicable to the region have been made at Mojave, Kernville, Keeler and Barstow (Tables 2 to 5). These indicate a depth of annual precipitation over the valley portions of this region of about 4 inches, which characterizes the climate as one of extreme aridity. The precipitation is greater in the Sierra Nevada Mountains, however, as is shown at the higher levels by the existence of pine trees, which require from 20 to 25 inches per annum to make any growth or even sustain life. The winter precipitation in the mountains is often in the form of snow.

The relation of elevation and precipitation along the east slope of the Sierra Nevada has been made the subject of careful study in recent years by the engineering staff of the Los Angeles Aqueduct in coöperation with the U. S. Geological Survey.[2] The results of these studies are presented on Diagram 1. They show that from the summit of the mountains eastward to the base there is a uniform decrease of precipitation with decrease in elevation. After leaving the mountains and passing out on to the plains, however, the decrease of precipitation with elevation becomes progressively less. The observed rate of decrease of precipitation with decrease elevation on the slope above Reno, Nevada, called the Central Pacific section, is 1.74 inches per 100 feet; twelve miles north of Independence, California, in the Taboose section, 0.46 inches per 100 feet; the same in Oak section, near Independence; and in Bairs section, ten miles south of Independence, 0.34 inches per 100 feet. Judging from the local vegetation and the precipitation records at Mojave, Barstow and Keeler, the annual precipitation at Brown is about 4 inches; at the base of the Sierra Nevada west of Brown 6 inches; and at the summit 22.5 inches. With this data the dotted line on Diagram 1 has been constructed showing the relation of elevation and precipitation in the Brown section. There is a somewhat similar relation for the west slope of the Argus Range, but the precipitation at the summit probably does not exceed 15 inches per annum.

DIAGRAM-1- RELATION ELEVATION AND PRECIPITATION ON EAST SLOPE SIERRA NEVADA MTS

The monthly variation in precipitation at Mojave is typical of California west of the Sierra Nevada Mountains and in the valley of southern California. There is a rainy season of about five months—November to March, inclusive—followed by a dry period of seven months. Summer storms of unusual severity occur in this region, however, which are peculiarly typical of the desert. They are called cloud-bursts and seldom last more than an hour. A large volume of water falls which, when collected into a narrow canyon, advances in a great wave carrying everything before it. These streams will extend far out into the valleys, depositing their loads of gravel, sand and silt as they advance. These storms are prevalent in July and August; are local in extent and usually gather about the higher peaks of the Sierra Nevada and Argus Range.

The annual variations in precipitation are characterized by great extremes. This is shown strikingly on Diagram 2, which represents the seasonal and three year progressive mean seasonal precipitation at Mojave, Cal. The three year progressive means have been joined by a broken line which shows the annual fluctuations smoothed out so that they are more easily followed by the eye. The mean seasonal precipitation is 5.1 inches, the least recorded during a season a trace, and the greatest 12.7 inches. There have been periods of eight consecutive years when the progressive mean was less than average, and eight progressive years normal or above. The average for three consecutive years has been below two inches per year twice in the last thirty-five years. The effect of such extremes upon the meager water supply of the region is to make it very unreliable.

Run-off from precipitation is almost unknown beyond the mouths of the mountain canyons. The cloud-bursts are the only storms providing sufficient rainfall to form a stream large enough to flow out into the valleys. The ordinary winter storms and slowly melting snows feed small streams in each canyon which, as soon as they reach the open valley, sink beneath the porous sands and gravels and are lost to view. The canyons most productive of run-off are along the slopes of the Sierra Nevada, such as Five Mile, Nine Mile, Sand and Grapevine. The run-off from these four drainage basins, measured at the mouths of canyons, probably would not exceed 100 acre-feet per square mile per year. The canyons of the Argus Range are less productive of run-off than those of the Sierra. The total run-off from the 360 square miles of mountain drainage directly tributary to Indian Wells Valley, measured at mouth of canyons, probably would not exceed 37 second-feet continuous flow, or 27,000 acre-feet per annum.

There is no surface run-off reaching the valley from Rose Springs Valley or Coso Basin. The streams entering these areas are lost into the sands soon after leaving their canyons. Their mountain drainage areas are no more productive than in Indian Wells Valley. It is thus apparent that the surface water supply of the Indian Wells Valley region which is derived from run-off is negligible outside of the mountain canyons. The storage of surface water within the canyons for use in irrigation of valley lands is entirely impractical, first, because of the small volume of water available in individual canyons and the excessive cost of constructing storage works; second, because of the excessive evaporation losses from a water surface in this desert region; third, because of the ideal storage reservoir provided by nature in the gravels of the open valley.

THE GROUND WATER RESERVOIR.

The great body of porous gravel lying upon the impervious rock floor of the Indian Wells Valley and surrounded on all sides by rock mountain walls, forms an underground reservoir in which large volumes of water can be stored. The basin in which this gravel has accumulated is impervious and there is no subterranean escape for water when it once enters the gravels. It is held as effectively as if stored in a surface lake or reservoir. The void space in ordinary sand and gravel, as found in nature, is between 20 and 35 per cent of the total volume. Hence in each cubic yard of saturated gravel there is from 40 to 70 gallons of water, or in an acre of saturated gravel one foot deep there is from 65,000 to 114,000 gallons. The depth of the gravels in the valley is possibly 250 feet, and their surface area exceeds 150,000 acres. The large storage capacity of the reservoir is thus apparent.

THE GROUND WATER SUPPLY.

The sources of supply of this reservoir are percolation from the streams which flow from the mountain canyons; percolation from direct precipitation upon the gravel; and underflow from Rose Springs Valley and the Coso Basin. Percolation from direct precipitation is too small to have any appreciable effect in replenishing the ground water supply. The underflow is also very small in amount. The movement of water in the soil seldom exceeds two or three miles per year and ordinarily is much less than this. Most of the underflow from Rose Spring Valley appears in the large spring and meadow at Little Lake and is lost by evaporation. The idea of there being a great stream of underground water from the Owens Valley flowing through Haiwee Meadows, Rose Springs Valley, and on into Indian Wells Valley, is entirely without foundation. The only course that such a stream could take would be through the narrow canyon below Haiwee Meadows where a dam has recently been built by the Los Angeles Aqueduct. This dam rests on bedrock and during the construction of the core well the entire underflow through the canyon, amounting to about 35 miner's inches, was pumped from the trench so that men could work. The source of this water is percolation from the streams originating in small canyons of the Sierra immediately west of the dam and not from Owens Valley. The entire water supply of that valley can be accounted for by evaporation losses from damp meadow and alkali lands and from the surface of Owens Lake. Most of the underflow from the Coso Basin is lost by evaporation from the dry

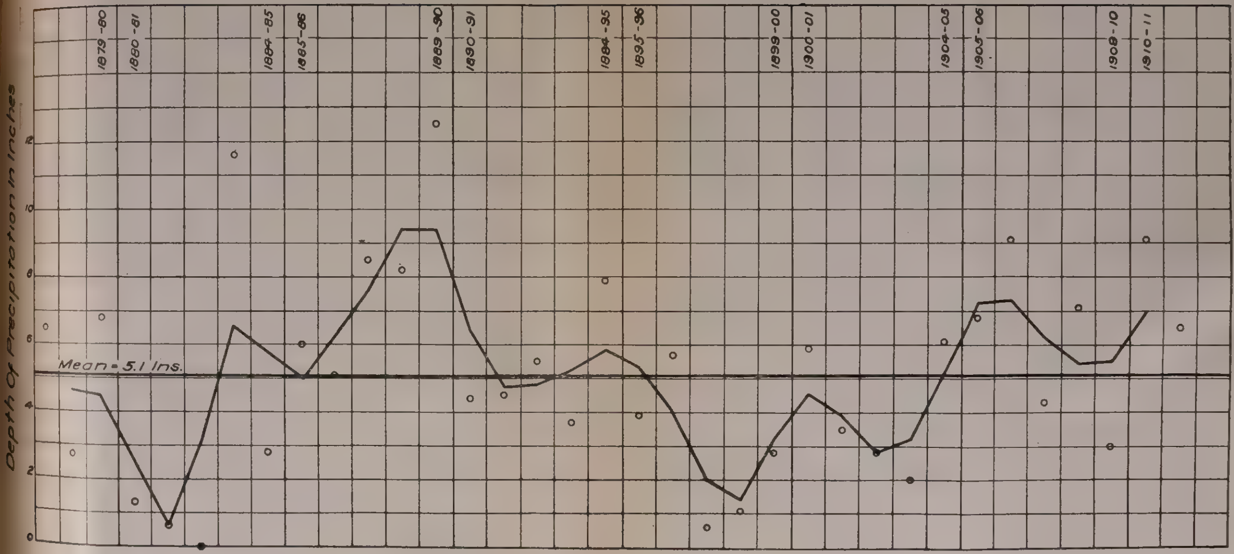

DIAGRAM-2-SEASONAL AND THREE YEAR PROGRESSIVE MEAN SEASONAL PRECIPITATION AT MOJAVE CAL.

lake basin in the lowest depression of the second valley. Hence the supply of the ground water reservoir in Indian Wells Valley is derived almost entirely from the tributary mountain canyons, from the little streams which lose themselves in the gravels as soon as they leave the mountains.

As soon as this water enters the porous gravels it percolates downward to the surface of the broad sheet of water underlying the whole valley. This water surface is not level as in a lake, but has a slope towards the east corresponding with the surface of the ground, although not as steep. The slope adjusts itself until the resistance of the gravel to the advance of the water is just balanced by the hydrostatic pressure. The water surface approaches closer and closer to the ground surface in advancing eastward across the valley. Near and within the dry lake-bed the water surface is within eight feet of the ground surface and the water is drawn up by capillary action of the soil and is dissipated into the atmosphere by evaporation. The percolation from the canyon water moves eastward down this slope toward the dry lake and finds an outlet by evaporation from the damp soils around and in the dry lake. The evaporating area is characterized by an alkali crust on the surface of the ground with damp soil beneath (Plate III). The alkali is that which the water had in solution and had left behind when evaporating. It accumulates in the soil from year to year. Although the water itself may be quite pure, the amount of alkali which is deposited during thousands of years is large and as the rainfall is insufficient to carry it away it continues to accumulate.

The average annual inflow and outflow from any reservoir, whether surface or subterranean, must be equal. Otherwise the reservoir would fill to overflowing or dry up entirely. The Indian Wells reservoir cannot overflow until China Lake fills with water to the level of the old outlet to Searles Lake, which is about 40 feet above the lake-bed, nor can it dry up as long as the evaporating area persists. The present conditions and the boundary of the evaporating area have not changed in many years. The inflow and the outflow from the reservoir must, therefore, be equal, considered as annual averages. Measurement of inflow and outflow for the closed ground water reservoir in the vicinity of Independence in Owens Valley has shown them to be equal for that reservoir.[1] Hence the rate of recharge of the gravels of Indian Wells Valley can be obtained by determining the loss by evaporation from the moist lands around within the China Dry Lake. This has been done as described elsewhere in this paper.

The effect of monthly and annual variation in the run-off from the mountain canyons is shown by the rise and fall of ground water levels throughout the basin outside of the evaporating area. Each winter the increased run-off builds up the ground water surface near the mountains and a wave of water starts down the slope. As it advances it flattens out and by the time it has reached the lower valley it is hardly perceptible. It is to be expected, therefore, that wells situated near the mountains will experience an annual rise and fall of considerable amount, the highest level occurring in late winter and the lowest in late fall. Out in the valley in the vicinity of Brown the fluctuation will not be so great and the highest level will be delayed several months, possibly until midsummer. Several miles east of Brown these fluctuations will hardly be noticed at all. The annual fluctuations are of longer duration. A series of wet years will build up the water surface from one year to another until it is considerably above average, while the reverse will occur during dry years. Examination of Diagram 2 shows that periods of eight years drought have occurred in the past when the rainfall was considerably below normal. The effect of such a drought upon ground water levels in the porous gravels of the Indian Wells Valley would be to materially lower them. During the last seven years the average rainfall has been above normal and at the present time the general ground water level is above the normal.

---

[1] Lee, Charles H., Ground Water Resources of a Portion of Owens Valley, California; Water Supply Paper 294, U. S. Geological Survey. 1912.

The artificial development of ground water from a reservoir of the type being described is made by sinking wells into the porous material and pumping water from them. The immediate effect is to drain the gravels in the vicinity, particularly on the side toward which the water surface slopes. As long as no more water is pumped than is flowing down the slope within the radius from which the pump draws there will be no permanent lowering of the water plane. If, however, more water is pumped than is supplied the water plane will fall and eventually, if pumping is continued at the same rate, will recede below the level from which the pump draws. The pump might then be lowered, but the only permanent remedy is to reduce the amount of water pumped. Considering the valley as a whole, if more water is pumped from it than is supplied by percolation, the general water plane will fall throughout the valley and the shallow pumps will soon be unable to reach the water plane. When enough pumps have been eliminated to reduce the total amount pumped to the amount supplied by percolation, the water surface will cease falling. If the shallow pumps are lowered and pumping resumed the water plane will again recede. There is no method by which more water can be drawn from a ground water reservoir than is supplied. The effective capacity of a ground water reservoir therefore is not its storage capacity, but is the rate at which the gravels are recharged each year by percolation from the mountain canyons. The amount pumped cannot exceed this if the supply is to remain permanent. It would be impossible to measure the amount of water percolating into the gravels, but it is feasible to measure the evaporation losses. The practical measure of the maximum amount which can be annually pumped from Indian Wells Valley is therefore the annual amount of evaporation from the moist soils in the lowest depression of the valley.

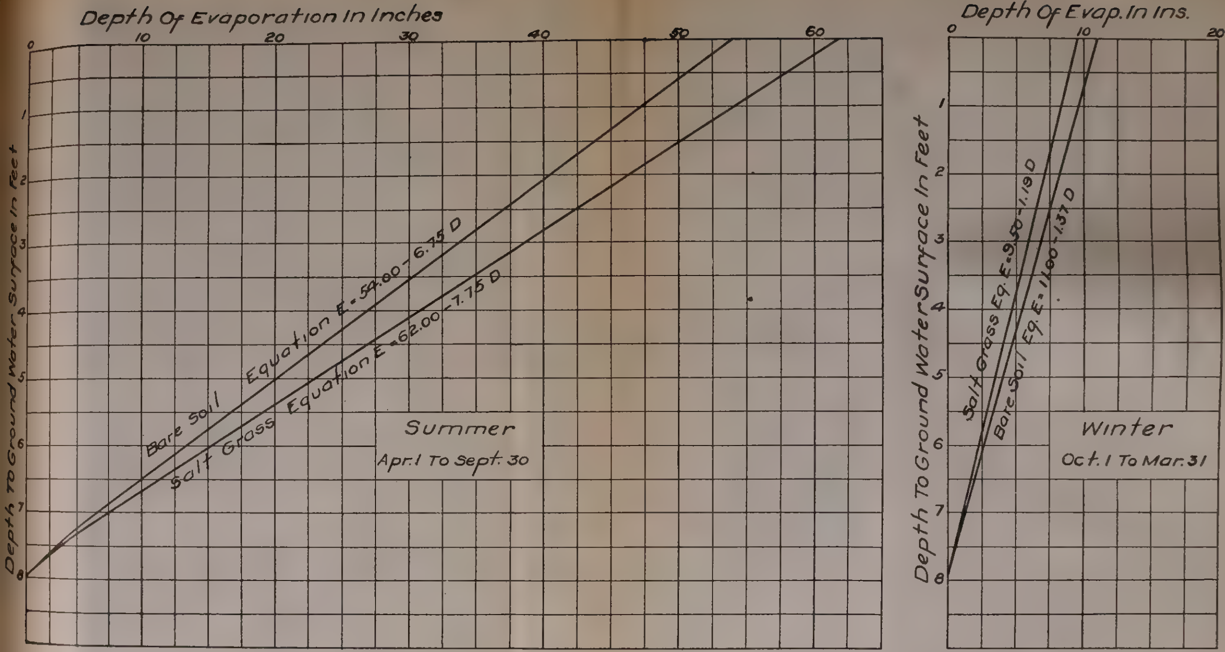

DIAGRAM-3-INDIAN WELLS VALLEY SOIL EVAPORATION CURVES

EVAPORATION LOSSES.

The subject of evaporation losses from damp soils has never been fully investigated. The most complete set of experiments tending to throw light on the general problem has been recently made in the Owens Valley, California, by the Los Angeles Aqueduct in coöperation with the United States Geological Survey.[1] The conditions under which these experiments were made are almost identical with conditions in Indian Wells Valley, both as to climatic conditions and soil characteristics. The ideas and relations there developed are the basis for determination of soil evaporation losses in Indian Wells Valley.

The rate of evaporation from soil varies proportionally with the depth to the ground water surface. When the ground water is at the surface of the ground there is a definite relation between the rate of soil evaporation and direct evaporation from a free water surface. When the ground water surface reaches a depth of from five to nine feet, depending upon the character of the soil, the evaporation loss is zero. Vegetation such as salt grass will cause a greater rate of soil evaporation during the summer months than from a bare soil. In Indian Wells Valley the depth of annual evaporation from free water surface is about 75 inches, 28 per cent of which occurs between October 1st and March 31st, and 72 per cent during the summer months. The depth at which zero soil evaporation occurs is about 8 feet. From this data and the most recent results obtainable from the Owens Valley experiments regarding the relation of soil evaporation at shallow depths and free water evaporation, were constructed a set of diagrams applicable to Indian Wells Valley (Diagram 3). One set is to be used during the summer months, April 1st to September 30th, and the other during the winter. One pair applies to bare soil and the other to soil with salt or marsh grass growing upon it.

The computation of total evaporation losses from the ground water of the valley requires a knowledge of the areas of bare soil and salt grass lands from which evaporation occurs together with a segregation as to the depth of the ground water surface. This was gained by personal examination of the lower portion of the valley, testing the depth of ground water in various places with a soil auger and making a survey of the outer boundary and subdivision lines of the evaporating area. The data thus obtained is presented in Tables 6 and 7, and on Plate II. The total evaporating area is 14.7 square miles, of which 7.2 square miles is in the lake bottom and the remaining 7.5 square miles borders the lake on various sides. The moist lands east of the lake bed and the adjacent portions of the lake bed are fed by percolating water from the Argus Range, the remaining areas from the Sierra Nevada.

The depth and volume from annual evaporation from each subdivision is presented in Table 8. The ground water surface in such an evaporating area has a regular annual fluctuation. It is at its highest level about March 15th, gradually recedes during the summer, reaching its lowest level about September 15th, after which it commences to rise. The amount of fluctuation under similar conditions in Owens Valley was about 3 feet between highest and lowest level. The observations of water level were made in Indian Wells between September 15th and 30th, the period of lowest level. Hence the average summer and winter depth to ground water is 1.5 feet less than the observed depth, thus making it possible to fill out the column of average depths in Table 8. The depths of evaporation for summer and winter are taken from Diagram 3. The grand total evaporation loss is 31,630 acre-feet per year or a continuous flow of 44 second feet.

---

[1] Lee, Charles H., Ground Water Resources of a Portion of Owens Valley, California; Water Supply Paper 294, U. S. Geological Survey, 1912.

AVAILABLE PUMPING SUPPLY.

It does not follow, however, that this amount of water can be annually pumped from the basin for use on the agricultural lands. About 30 per cent of it is derived from percolation from the Argus Range. The lands between these mountains and the lake are not adapted to agriculture and the cost of developing water east and northeast of the lake and delivering it west of the lake is too great to make it possible from an economic standpoint. There is about 22,000 acre feet of water derived from the Sierra Nevada Mountains and the Rademacher Hills which percolates beneath the agricultural land toward the lake bottom. It is a practical impossibility to intercept all of this subterranean flow because of its diffusion over such a wide area. It is possible that by exercising judgment in locating wells and pumping plants 50 per cent of this volume, or 11,000 acre-feet, could be annually developed for use.

The soils of the valley vary from open sandy loams of the upper slopes to the very fine grained sediment soils of the lower valley which resemble deposits of water-transported volcanic ash. These latter soils are entirely devoid of humus and are almost impenetrable to water. Generally speaking the sandy soils merge into the fine silt between the 2,250 and 2,200 foot contours (Plate II).

The amount of water required to raise crops in the valley will vary from two to eight acre-feet per acre per year, depending upon the crop and the character of the soil. The sandy soil will take almost as much water as is applied to it, while the close soils of the lower valley will not take much more than two to four acre-feet per acre per annum. Fruit trees do not require as much water as field crops. It can be broadly said that the sandy soils will require from five to eight acre-feet per acre per annum and the close soils of the lower valley two to four. The sandy soils will probably require more than this during the first few years of irrigation. It is, therefore, apparent that with the exercise of good engineering judgment in locating wells and farm lands enough water can be developed in Indian Wells Valley to irrigate between 1,500 and 2,500 acres. The area of land which can be considered as suitable for agriculture if water were available is about 90,000 acres.

AREA WHICH CAN BE IRRIGATED.

If it is attempted to cultivate permanently 2,000 acres of land in Indian Wells Valley, it should be done in somewhat the following manner: In the first place the unit area of cultivation should not exceed that which can be irrigated from one well continuously or several wells used one at a time. Such an area should not exceed 40 acres. The wells should be so located on each farm unit that they are not closer than 1½ miles to a well on any other farm unit. The best location for these farms as regards water-supply is between the 2,175 and 2,400 foot contours as shown on Plate II. The number of regularly pumped wells in the valley should not exceed fifty and the amount pumped from each well should not exceed 200 acre-feet per acre per year, or 55 miner's inches twelve hours a day for six months.

TABLE 6.

Description of Auger Test Holes Within and Near China Dry Lake, Indian Wells Valley.

Test hole.	Location.	Surface characteristics.	Character of material.	Depth to groundwater September 24-26, 1912, feet.
A	NE. ¼ Sec. 25, T. 25 S., R. 39 E.	Light colored smooth clay surface with scattered salt-grass.	2½ feet brownish yellow clay, 1½ feet fine reddish sand cemented, 2 feet fine gray sand with clay, clean quartz sand with water.	6.2 (Moist 4 inches below surface.)
B	NE. ¼ Sec. 25, T. 25 S., R. 39 E.	Thin alkali crust not puffed up. Scattered salt-grass.	4 feet light chocolate clay, 1¾ feet reddish silt to fine sand, 9 inches greenish gray clay, clean quartz sand with water.	6.7 (Moist 3 inches below surface.)
C	SE. ¼ Sec. 31, T. 25 S., R. 40 E.	Hard alkali crust ⅛ inch thick and puffed up. No vegetation.	3 feet fine sand, 1 foot transition to coarse sand, 2 feet coarse sand underlaid by crumbly clay.	6.0 (Moist under alkali crust.)
D	Near N. ¼ corner Sec. 4, T. 26 S., R. 40 E.	Thin film white alkali and scattered salt-grass; surface smooth.	2 feet fine sand, 1 foot coarse sand, 1 foot yellowish gray clay, coarse water bearing sand.	4.75 (Surface moist.)
E	SW. ¼ Sec. 36, T. 25 S., R. 40 E.	Tough alkali crust ½ inch thick. Short salt-grass. Surface smooth.	2 feet yellow clay, 9 inches fine green sand, 9 inches tough green clay, 9 inches coarse green sand, 3 inches tough green clay, coarse water bearing sand.	4.3 (Moist ½ inch below surface.)
F	SW. ¼ Sec. 6, T. 25 S., R. 41 E.	Alkali crust puffed up, broken and very uneven surface; scattered salt-grass.	4 feet fine yellow sand merging into coarser sand, clean quartz sand with water.	4.6 (Moist under alkali crust.)
G	Near N. ¼ corner Sec. 13. T. 25 S., R. 40 E.	Thin film white alkali; surface smooth.	Chocolate colored silt	3.2 (Surface moist.)
H	Sec. 9, T. 24 S., R. 40 E.	Thin film white alkali; surface smooth.	Chocolate colored silt with salt crystals	4.13 (Surface moist.)
I	Sec. 9, T. 24 S., R. 40 E.	Thin film white alkali; surface smooth.	Chocolate colored silt with salt crystals	3.23 (Surface moist.)
J	Sec. 9, T. 24 S., R. 40 E.	Thin film white alkali; surface smooth.	Chocolate colored silt with salt crystals	3.00 (Surface moist.)

TABLE 7.

Classification of Moist Lands Situated Within and Around China Dry Lake, Indian Wells Valley.

No.	Location.	Description.	Area in square mile.	Approximate depth to water in feet September 30.		
				Maximum.	Minimum.	Average.
I.	Upper Lake bottom.	Bare clay mud with slight alkali film; surface wet.	1.86	4	3	3.5
II.	Lower Lake bottom.	Bare hard clay with areas roughened by surface swelling; moist ⅔ of an inch below surface; no surface alkali showing.	5.40	5	4	4.5
III.	Bordering Lake east near old borax works.	Sparse growth salt-grass; alkali crust much broken and puffed up by swelling; moist beneath crust.	1.43	5	3.5	4.5
IV.	Bordering Lake south.	Bare soil; gray alkali crust with white spots; hard, brittle and puffed up; moist beneath crust.	0.64	5	4	4.5
V.	Bordering Lake in narrow zone, various portions.	Sparse growth salt-grass; alkali crust; transition zone from moist lake bottom to desert sands surface moist to dry.	2.00	7	4	5.5
VI.	Bordering Lake in long arm to west.	Sparse growth salt-grass; alkali crust; follows a swale and alkali and salt-grass more prevalent near drainage line.	3.38	6	5	5.5

TABLE 8.

Annual Evaporation from Moist Lands Situated Within and Around China Dry Lake, Indian Wells Valley.

No. of area.	Area in square miles.	Average depth to ground-water, feet.	Depth of evaporation per annum in inches.			Volume in acre-feet.	Equivalent flow, second-feet.

WELL DATA.

The well data collected during these investigations is by no means complete. It was planned to visit typical wells in various parts of the valley and determine approximate location, kind of well, depth, use, method of lift, depth to water, approximate elevation of ground surface and, if possible, the log. There were examined in all thirty-nine wells, consisting of about one third the total of wells in the valley. The wells chosen for study are distributed so as to give a knowledge of the depth to water throughout the valley and will be valuable as definite points at which to make future measurements. These wells are listed in Table 9, and their location is indicated on Plate II. The location of the wells is approximate, having been determined in the field by reference to roads, fences or clearings, and in some cases from the owner or driller. The approximate elevation of the surface at each well was obtained by interpolating between contours on Plate II. Depth to water is not from top of casing, but from surface of ground.

The depth to water as measured in the different wells varies from less than 10 feet to 280 feet below the ground surface. The latter depth was observed in well 32, which is located one mile northwest of Inyokern, and is higher up the slope than any of the others. The shallow depths occur near the dry lake basin. The relative positions of the ground surface and ground water surface between the Southern Pacific Railroad and the dry lake bed is shown graphically by the three profiles of Plate V. One profile extends east from the railroad near Brown along the section line one mile south of the Kern-Inyo County line. The depth to water at the railroad is approximately 180 feet and the slope of the water surface 15 feet per mile. This slope gradually flattens out toward the east and since the overlying ground surface is steeper the two surfaces approach each other. Near the west edge of the lake bottom the depth to water is less than eight feet and from here east the water surface is level across the lake bottom. The difference of elevation of water surface between the railroad and the west edge of the evaporating area, a distance of 12 miles, is about 125 feet. The average slope of the water surface is 10 feet per mile.

The next profile is five miles south of county line, about one mile north of Muerto Siding, and extends east. The depth to water at the railroad is about 80 feet and continually decreases until the evaporating area is reached. This profile follows the center of a broad depression extending west from the lake bottom and the ground water conditions correspond with those of the first profile from the 2,300 contour east. The difference of elevation of the water surface between the railroad and the west edge of the evaporating area, a distance of 11 miles, is about 100 feet. The average slope of the water surface is thus nine feet per mile.

TABLE 9.

List of Typical Wells in Indian Wells Valley.

The third profile marked X-Y on Plate II, extends from a point on the railroad about two miles south of Inyokern in a northeast direction to an intersection with the profile from Muerto Siding. The depth of water at the railroad is about 250 feet and decreases to about six feet at the salt grass area near the end of the profile. The difference of the elevation of the water surface is 85 feet in a distance of nine miles, making the average slope nine feet per mile.

It can be said that in the vicinity of Brown and Muerto Siding the depth of water along the 2,400-foot contour, as shown on Plate II, is about 150 feet. Further south the depth increases to 200 feet at a point two miles south of Inyokern. The depth decreases toward the east, rapidly at first and then gradually. Within the area of alkali land the depth is less than eight feet. The slope of the ground water surface is within the 2,400-foot contour varies from a maximum of 20 feet per mile near Inyokern to horizontal beneath the lake bottom.

PLATE IV-A.—North arm of China Dry Lake.

The average slope between the 2,400-foot contour and the west edge of the evaporating area is between 9 and 10 feet per mile.

The slope of the ground water surface of this type depends upon the rate at which it receives accretions from the sources of percolating water along the base of the adjacent mountains. When the supply is abundant, as in Owens Valley or San Bernardino Valley, the slopes are steep. For example, opposite Mentone and Redlands in San Bernardino Valley the ground water slope averages 70 feet per mile for several miles, while near Independence in Owens Valley the slope is 90 feet per mile and becomes steeper near the mountains. The ground water basins having abundant water-supply are also characterized by strong flowing springs and cienegas around and in the gently sloping or level portions of their lowest depression. The characteristics of abundant ground water supply are all lacking in Indian Wells Valley and thus tend to confirm the earlier conclusions of this study that the supply of ground water is very limited.

The logs of nineteen wells were obtained, some of them from owners but most of them from local well drillers who were very accommodating in furnishing data. None of these wells are situated in T. 25 S., R. 39 E.; six in T. 26 S., R. 39 E.; two in T. 26 S., R. 40 E.; and the other two scattered. The well depths vary from 124 to 339 feet. The logs are all very similar, showing in general a succession of layers of clay and coarse water bearing gravel with occasional layers of fine sand. The per cent of water bearing gravel to the total depth of well varies from 13 to 62 but in most of the wells is about 35 per cent. The gravels are open and coarse and yield water readily. The best water bearing material lies south of the Kern-Inyo boundary, west of the 2,175-foot contour and west of the north and south center line through T. 26 S., R. 40 E. There is a tendency toward fine sands and clays along the center of the depression extending east from Muerto Siding.

Following are the logs from four typical wells:

Well 14: D. W. Shanks, owner; located in northeast quarter of section 4, township 26 south, range 39 east:

Soil and sand, dry	surface to 80 feet
Water bearing gravel	80 to 85 feet
Clay	85 to 95 feet
Water bearing gravel	95 to 105 feet
Clay	105 to 115 feet
Water bearing gravel	115 to 139 feet
Clay	139 to 145 feet
Water bearing gravel	145 to 152 feet
Clay	152 to 157 feet
Water bearing gravel	157 to 162 feet
Clay	162 to 183 feet
Cemented sand	183 to 188 feet
Sandy clay	188 to 198 feet
Clay	198 to 214 feet
Water bearing gravel	214 to 250 feet
Fine sand, water bearing	250 to 265 feet
Water bearing gravel	265 to 292 feet
Cemented sand	292 to 295 feet

Well 3: S. R. Smith, owner; located in northwest quarter of section 19, township 25 south, range 39 east:

Soil, sand and gravel	surface to 160 feet
Water bearing gravel	160 to 180 feet
Clay	180 to 242 feet
Water bearing gravel	242 to 247 feet
Clay	247 to 249 feet
Fine sand	249 to 265 feet
Cemented sand	265 to 269 feet
Water bearing gravel	269 to 272 feet
Clay	272 to 285 feet
Water bearing gravel	285 to 290 feet
Clay	290 to 294 feet
Water bearing gravel	294 to 325 feet

Casing landed in clay.

Well 24: W. M. Randall, owner; located in the west half of section 14, township 25 south, range 39 east:

Soil and sand	surface to 38 feet
Water bearing gravel	33 to 63 feet
Clay	63 to 71 feet
Water bearing gravel	71 to 75 feet
Clay	75 to 93 feet
Water bearing gravel	93 to 101 feet
Clay	101 to 120 feet
Water bearing gravel	120 to 145 feet
Fine sand	145 to 155 feet
Sandy blue clay	155 to 200 feet

Well —: Henry V. Hoffman, owner; located in the east half of section 27, township 26 south, range 40 east:

Soil and hard cemented sand	surface to 8 feet
Dry gravel	8 to 50 feet
Cemented sand	50 to 90 feet
Sand and shale	90 to 124 feet
Sand	124 to 127 feet
Shale	127 to 164 feet
Water bearing sand	164 to 167 feet
Shale	167 to 258 feet
Water bearing gravel	258 to 260 feet

There are eight wells in the valley that have been equipped with modern power pumps which are delivering water for irrigation use. The pumps are of various types, including centrifugal, rotary and deep well plunger pumps (Plate IV, B). Power is supplied by gas engines at present, but in the near future electricity will be available from the Southern Sierra Power Company, whose transmission line from Bishop Creek to San Bernardino passes through the valley just east of the railroad. The best wells which have been tested yield less than 60 miner's inches and are reported to have a pumping water level from

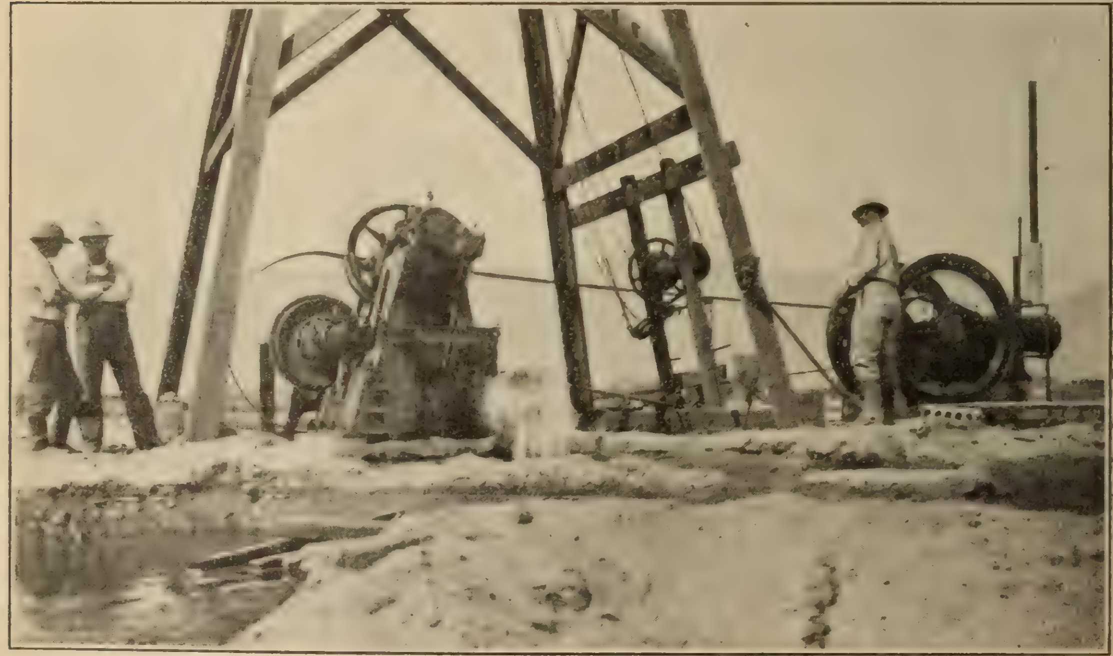

PLATE IV-B.—Pumping plant at Well 1 under test.

20 to 40 feet below normal. None of them yield as much water as is being pumped with the same equipment and lift from wells in regions of more abundant ground water supply. This is probably due to the flat slope of the general ground water surface and the resulting slow movement of ground water toward wells to replace water which is being pumped out. It is a further confirmation of the fact that the water-supply is limited.

The quality of the well waters is excellent for domestic or irrigation use throughout most of the settled portions of the valley. In wells nearer the dry lake, however, the mineral content increases and ground waters beneath the lake are heavily charged with the soluble salts typical of the region. The 2,175-foot contour can be taken as the approximate dividing line between waters which are fit for domestic use and those which cannot thus be used permanently. It is possible that waters pumped from wells as far east as the 2,150-foot contour could be used for irrigating but the ultimate effect would not be beneficial to the plant growth.

CONCLUSIONS.

1. The total volume of water which can be annually pumped from the gravels underlying the agricultural land in the Indian Wells Valley, without permanently lowering the ground water levels, does not exceed 11,000 acre-feet per annum.

2. To develop this amount of water the distance between regularly pumped wells should exceed one and one-half miles and not more than 200 acre-feet per year (50 miner's inches, twelve hours per day for six months) should be pumped from any one well.

3. The best location for wells is between the 2,400 and the 2,175-foot contour of Plate II, west of the north and south center line of T. 26 S., R. 40 E., and south of the Kern-Inyo County line.

4. The total number of acres which can be irrigated by means of this water-supply is about 2,000 acres, and the area which can be irrigated from each well not more than 40 acres.

5. Measurements of the depth to water in typical wells should be made at least annually to determine the effect of pumping upon the water plane.

6. The water supply of Indian Wells Valley is sufficient to irrigate not more than 3 per cent of the agricultural land.

7. Water supply conditions in other desert valleys of southeastern California are similar to those described for Indian Wells Valley.

EXHIBIT E.

California State Conservation Commission,
Mills Building, San Francisco, Cal.

BERKELEY, CAL., March 7, 1912.

GENTLEMEN:

I beg to submit herewith, in accordance with your request, a brief statement with reference to the dredged land situation in this State and its effect on the amount and value of agricultural lands of California. Before making such statements as may seem pertinent on the basis of my visit to the dredged districts of Oroville and Folsom, I wish to submit some statistical information which may tend to make my remarks of more definite significance. I am indebted for these statistics to Mr. H. F. Bain, who included them in his report to the Section on Conservation of the Commonwealth Club on the subject of minerals in California.

From 1900 to 1911 the amount of gold produced by the world through dredging shows an increase from 1 per cent to 1.65 per cent, taking 100 per cent as the total product of the world. The following table further gives an idea of the dredging ground in the various counties of California available for such purposes:

Counties.	Total proven dredging ground.	Total acreage owned by dredging companies.
Butte	6,600	8,900
Yuba	3,600	5,500
Placer	430	990
Sacramento	6,050	12,500
Calaveras	850	850
Stanislaus	200	1,000
Merced	400	500
Shasta	700	2,000
Siskiyou	370	450
Totals	19,200	32,690

The statement appended to these figures shows that probably less than 5.000 acres have already been dredged. I shall refer to this matter later. Then as to the amount of gold produced through dredging as compared with that produced from other sources in California, we find the following statistics:

Source.	1898.	1909.
Deep mines	$12,488,321	$11,133,437
Placers—		
Drift mines	1,028,547	739,797
Surface placers	1,841,473	376,078
Dredging	19,000	7,382,950
Hydraulic	962,192	605,608

It is also well to add to these figures a table showing the rapid increase in dredging every year since 1898.

1898	$18,847
1899	133,812
1900	200,369
1901	471,934
1902	801,295
1903	1,488,556
1904	2,187,038
1905	3,276,141
1906	5,098,359
1907	5,065,437
1908	6,536,089
1909	7,382,950

LOCALITIES AND AREAS OF PRESENT DREDGING OPERATIONS.

The largest dredging areas in California to-day are undoubtedly in the Oroville and Folsom districts and along the Yuba River. The acreage dredged, in accordance with statements of people on the spot, who should have authoritative information, would seem to be much larger than that reported in the figures above noted. That is to say, Mr. Leggett, at Oroville, told the writer that in his opinion, more than 5,000 acres had already been dredged at Oroville alone and that 2,000 acres more would probably be dredged in that district. That does not take into consideration a very considerable area at Folsom and on the Yuba River. It suffices for our purposes here to know that, while 7,000 acres may be the total for the Oroville district, the lands now being dredged by the Natomas Consolidated, at Folsom and vicinity, will no doubt show an increase in acreage year by year. Mr. Leggett is also authority for the statement that the largest amount of dredging will be done along the Yuba River. In other words, we are facing a condition where dredging is to be carried out, not merely on a limited area, but in several different parts of the State, and will undoubtedly increase, as gravelly lands, by assay, have shown them worthy of being dredged for gold.

THE KIND OF LAND BEING DREDGED.

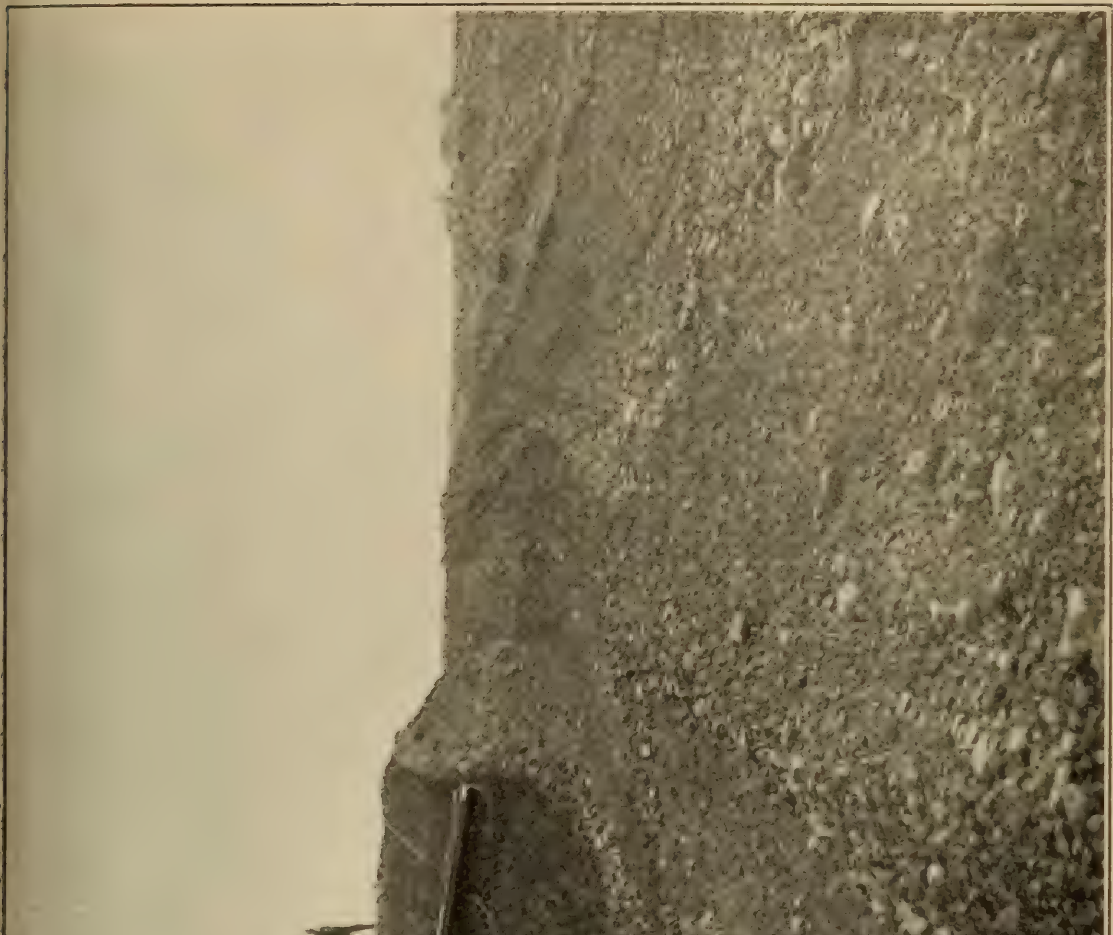
I think it is safe to say that the largest part of the land dredged at Oroville was, from the agricultural standpoint, of little value. It is Mr. Leggett's opinion that only 10 per cent of the land that has been thus far dredged in the Oroville district was at all fit for agricultural purposes. In the Folsom district it is estimated that approximately 20 per cent of the land thus far dredged was fit for agricultural purposes, while, as regards the Yuba River district, it is hard to give an estimate of the amount of land actually fit for agriculture, which is now being dredged or is to be dredged in the future. In this connection it should be remembered that considerable areas of land are being purchased by the various dredging companies in the Folsom district and along the Yuba River which are producing good crops and which are being made unfit to a greater or less degree, as will be later discussed, by dredging.

THE RECLAMATION OF DREDGED LAND.

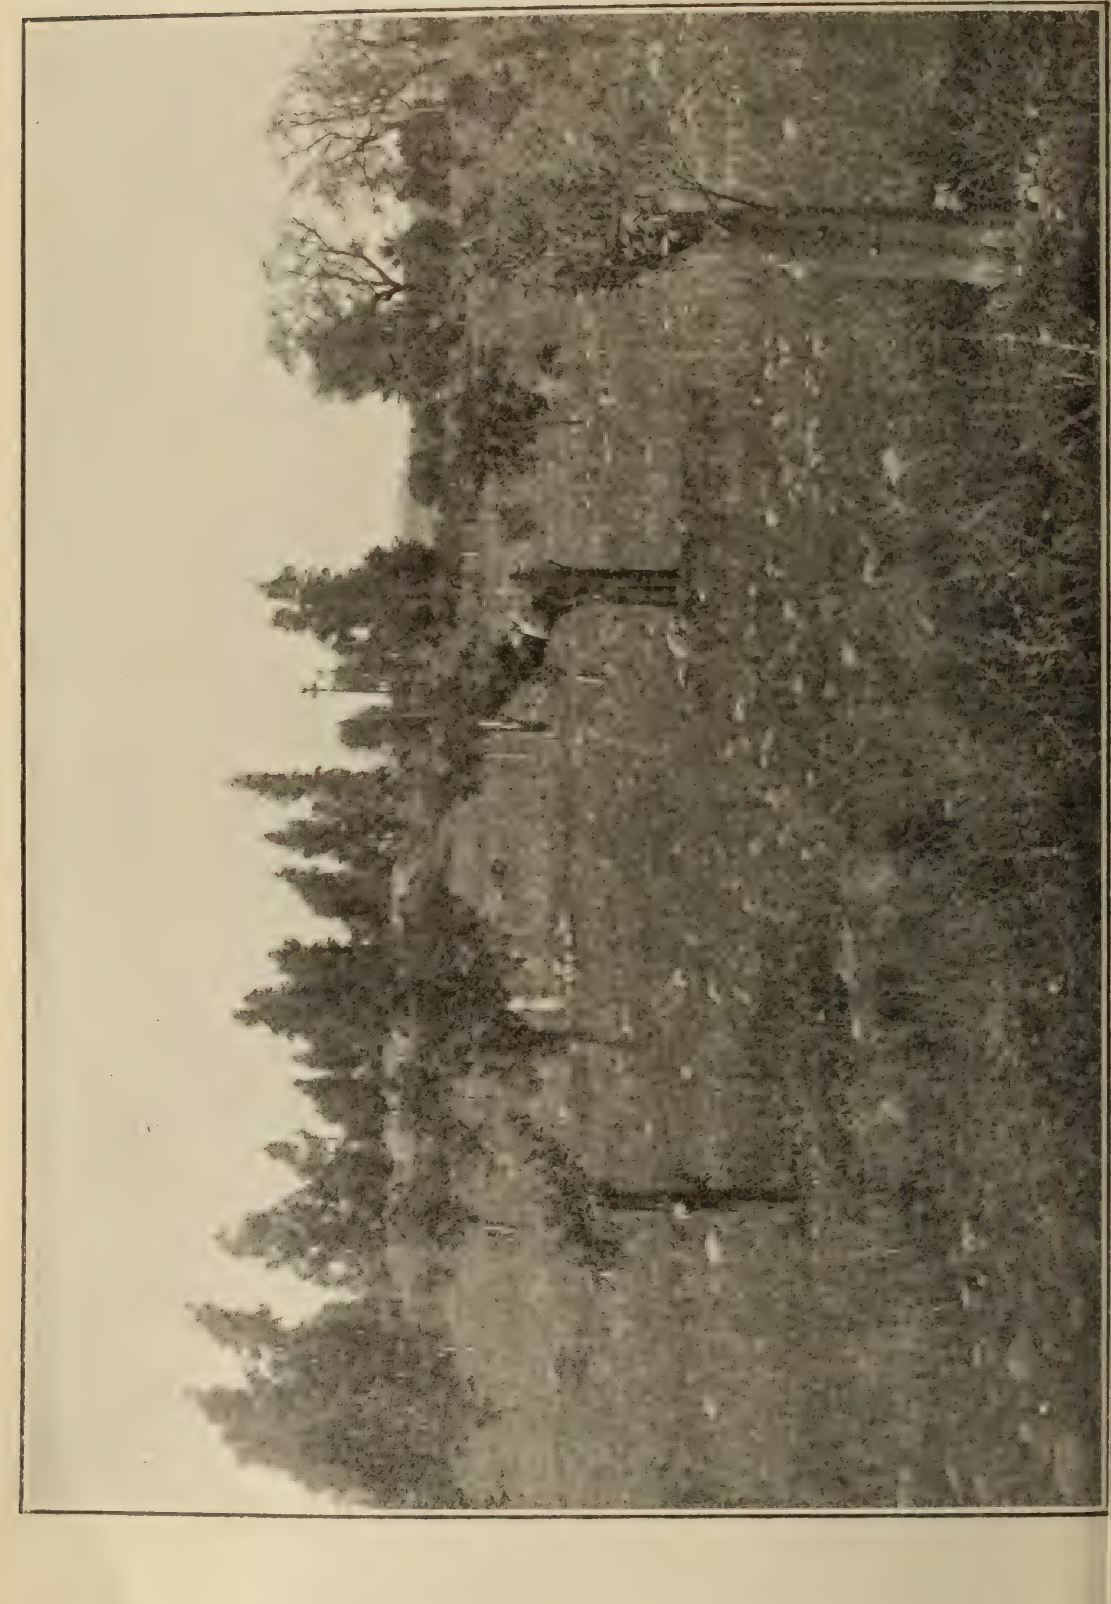
In connection with the subject of whether or not dredging of land should be allowed, an eminently pertinent question arising is "Can dredged land be reclaimed for agricultural purposes?" Before giving my own opinion in the matter, I may give an account of the observations I have made of the two attempts at the reclamation of dredged land; one at Oroville by Mr. Leggett, and the other at Natoma, near Folsom, by the Natomas Consolidated.

On a ten-acre lot, which has been leveled after dredging, Mr. Leggett planted a large variety of fruits, among them vines, figs, apricots, peaches, oranges, olives and walnuts. The oranges and olives were old trees which had been cut back and moved to the new land from old orchards. The other fruits were planted from young stock. For all plantings, top soil was put into every hole to start the plant on. The oranges and figs are, to judge from Mr. Leggett's experiment, a failure without doubt, while the others seemingly do fairly well, but, with the exception of the vines, have attained only a small growth, though showing good blossoming and fairly good fruit production. It is hard to say now, since the walnuts and olives are both too recently planted to produce, whether or not they will produce sufficiently to make them profitable. Mr. Leggett has also planted, on adjacent land to the oranges, eucalyptus trees now nearly seven years old without any leveling of the débris. It must be stated here that these eucalyptus trees are all looking fine and apparently vigorously and rapidly growing.

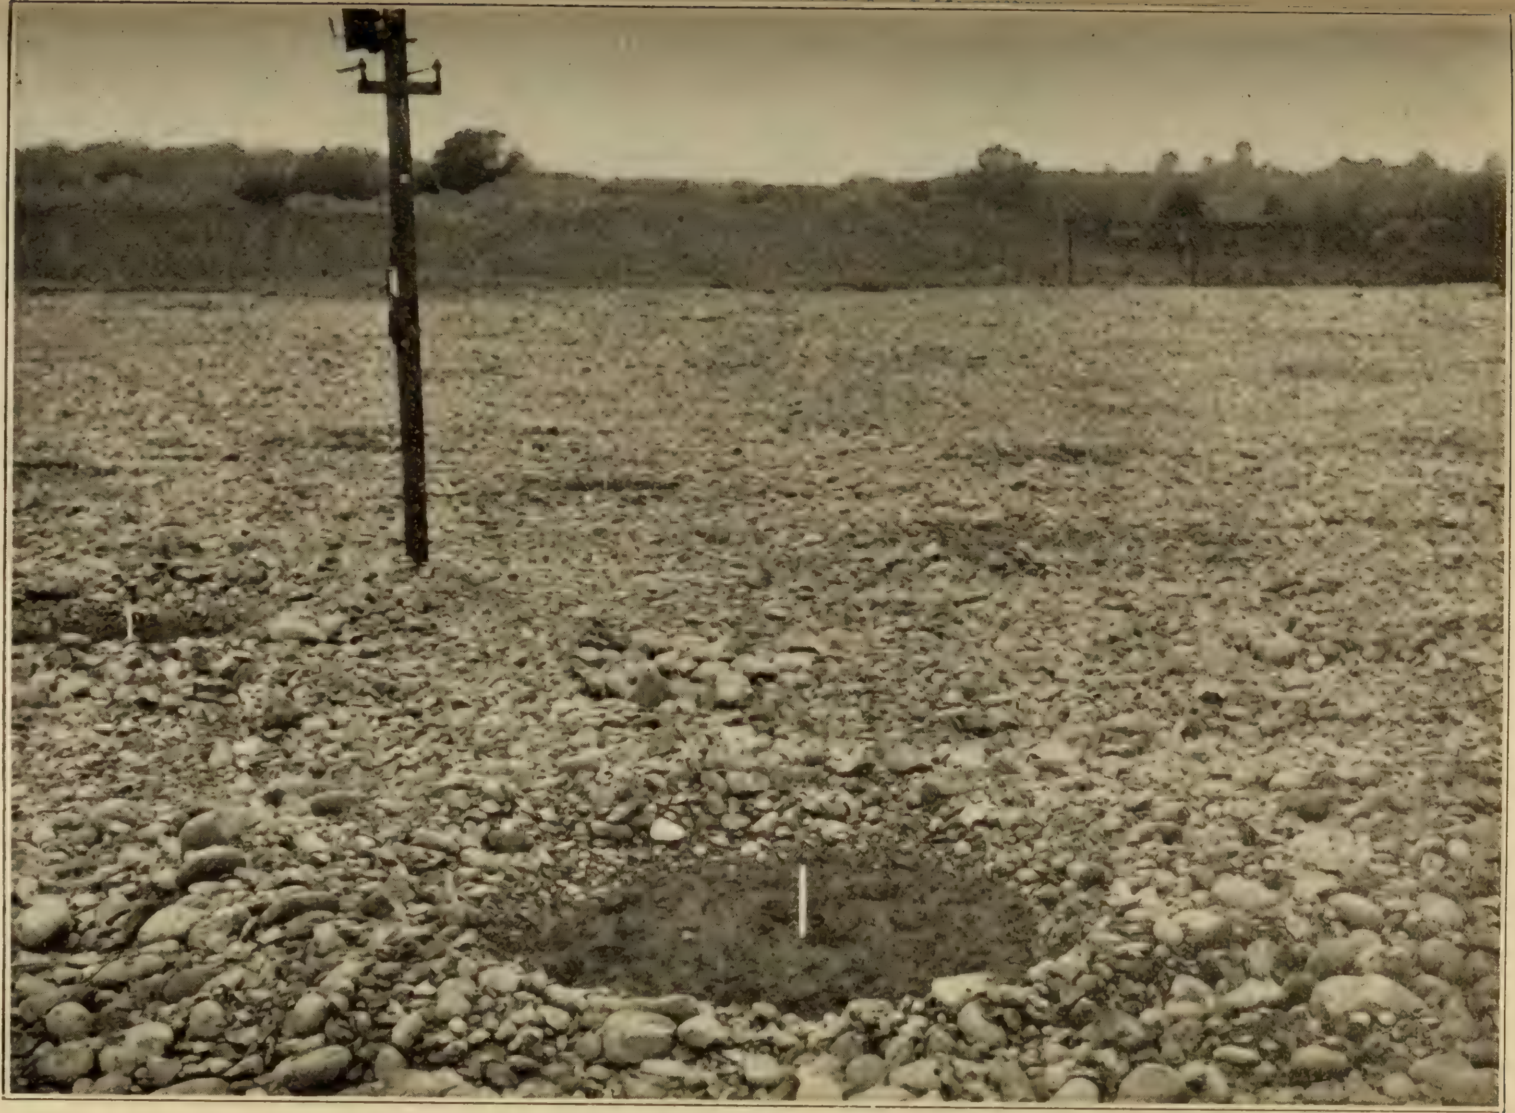
The attempt at reclaiming the dredged land near Natoma by the Natomas Consolidated has been more systematically and carefully carried out than Mr. Leggett's work. They have very carefully leveled the land in terraces and have thus far planted 15 acres in eucalyptus trees about one third each of 1-year, 2-year, and 3-year old trees. There are, at the present time, being prepared 15 acres more for olives,



Reclaiming Dredged Lands.



Old trees planted on the dredged land near Oroville.



The young tree is started by good soil being placed in the hole excavated for it.

which will be planted shortly. In each hole in which the tree was planted a wagon load of good top soil was placed to start the tree and it is reported (whether authentically or not, I cannot say) that the preparation of the land thus planted by the Natomas Consolidated involved an expenditure of $250 per acre. As regards the condition of the eucalyptus trees described above, it must be stated that they are all doing well and evidently making a vigorous growth, not any, in any way so far as I can see by an examination of them, showing any effects from lack of plant food or water. It should be noted, however, that in both cases in which planting was done on dredged land, top soil was placed into the holes for planting the new trees. Regardless of whether or not the figures above given for the reclamation per acre are authentic, the expenditure certainly must be large. In other words, what I mean to bring out by this statement is that it is doubted if, in a small way by private individuals, such dredged lands can be reclaimed and made to pay a profit on the investment. I am inclined to the belief that that is impossible, unless future experiments with fruit trees should yield larger profits per acre than can be obtained from eucalyptus.

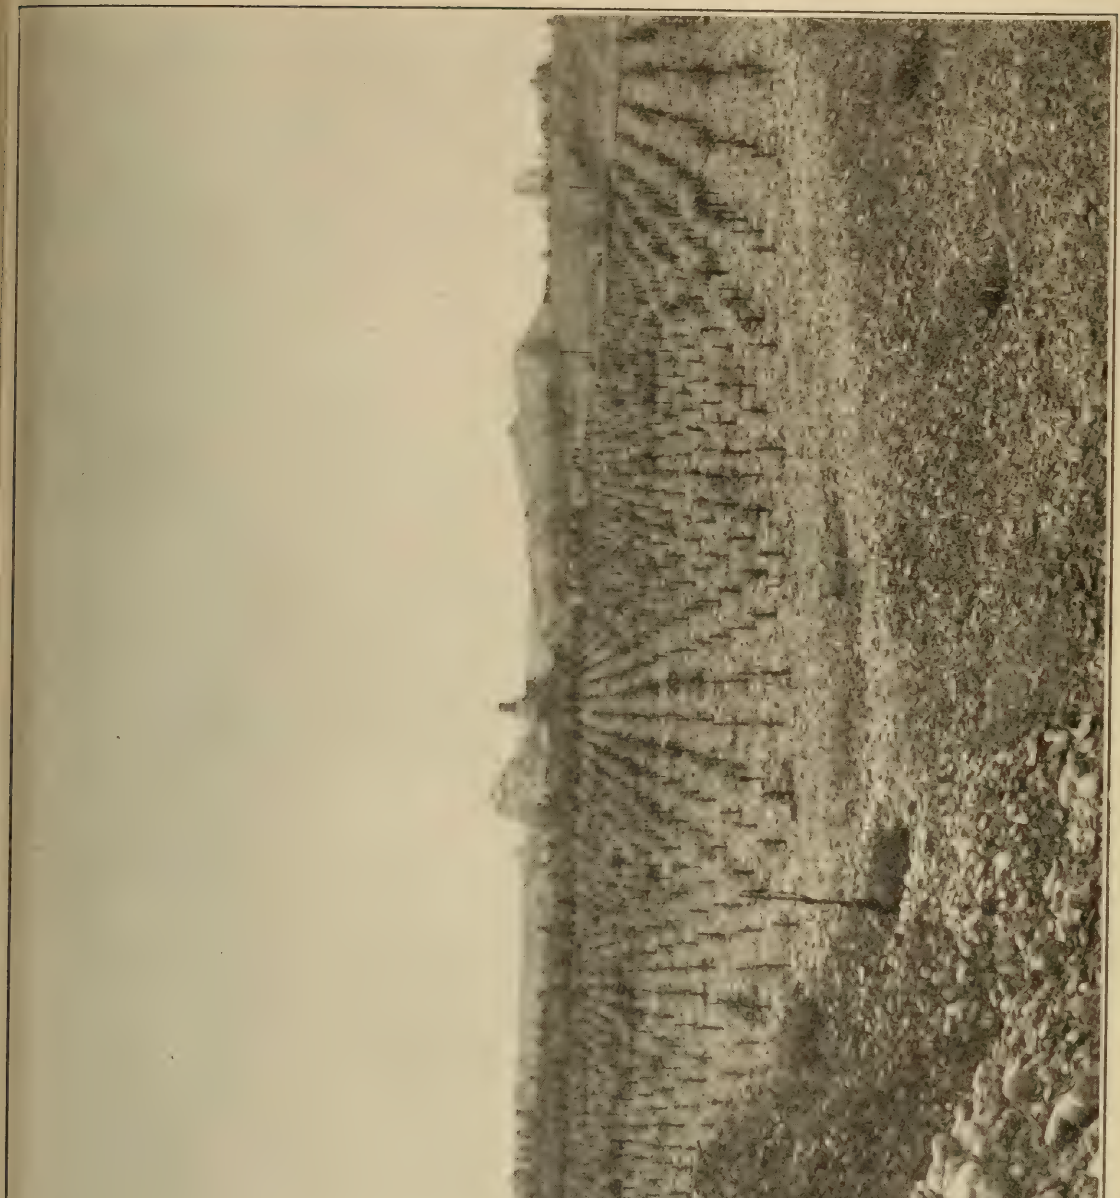
Another point which must be brought out in this connection is that the nature of all the dredged land is not the same, viz., there are portions of the dredged material which contain only small quantities of soil, whereas others contain large quantities of good soil. Hence, it is only reasonable to suppose that the latter might, with a fair start, be a good medium for root development and hence for plant growth, whereas the former might be useless. This is a distinction between the different kinds of dredged soil which, in my opinion, cannot be overlooked in considering the value of dredged lands for agricultural purposes.

THE ESTHETIC POINT OF VIEW.

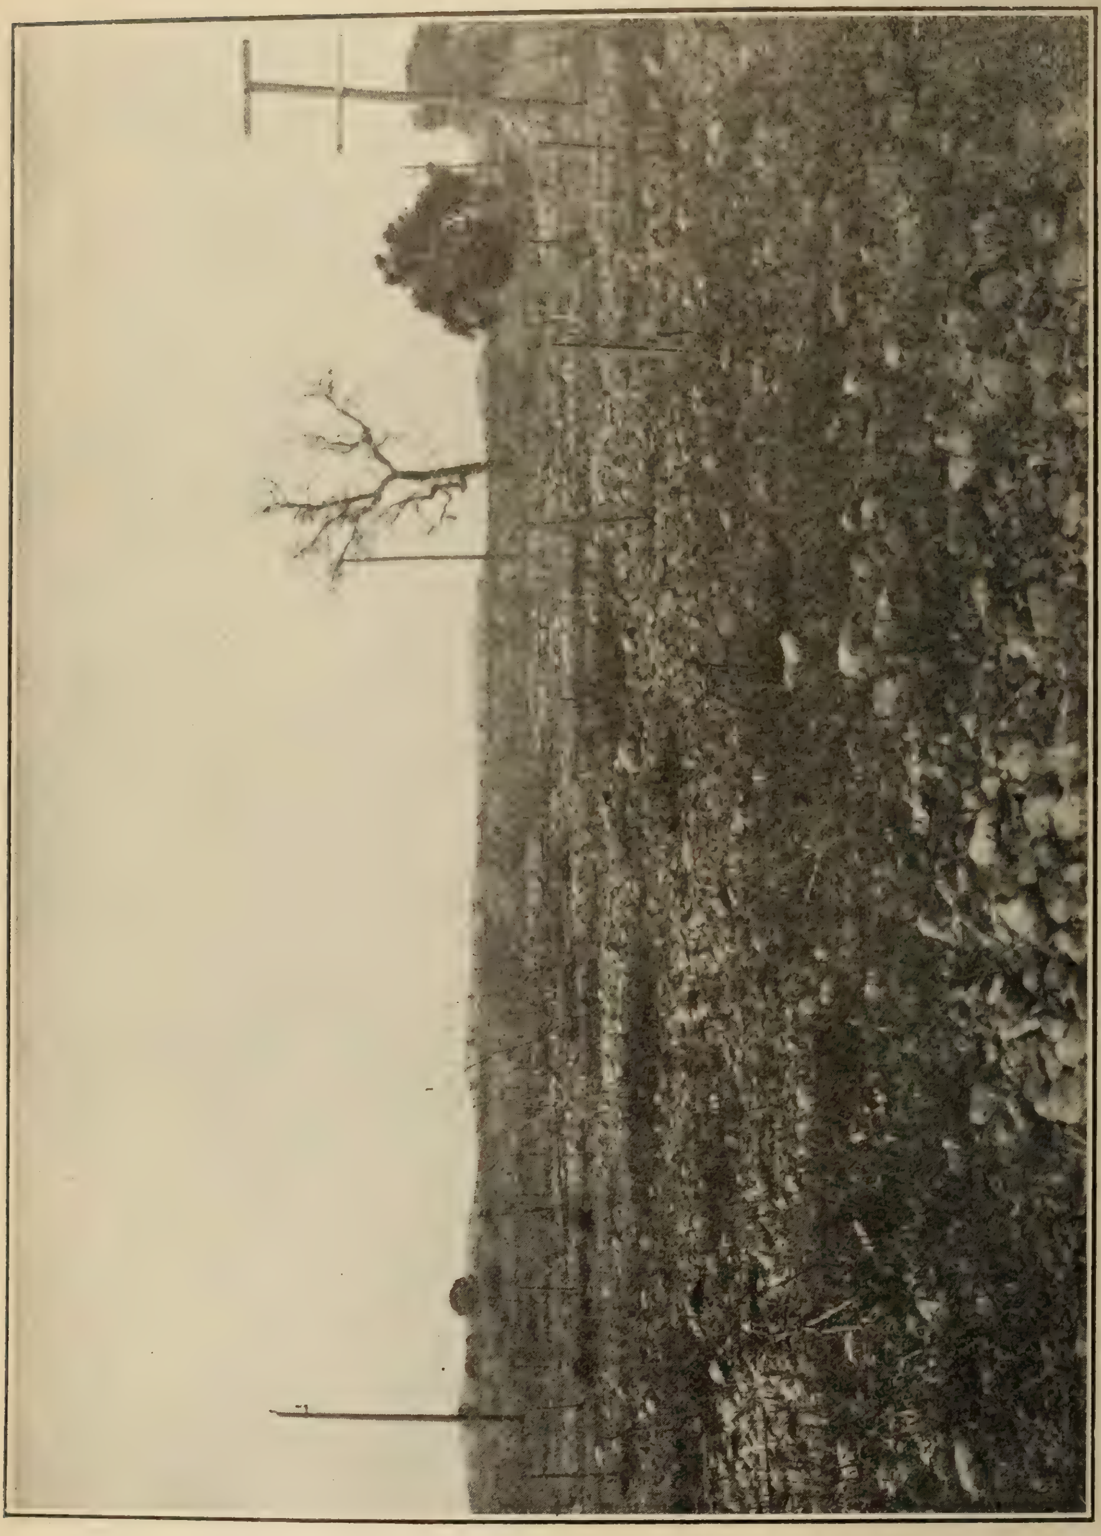
Outside of and in addition to all other considerations, I think that even the most practical minded will concede that the esthetic phases of the question of the dredged land in California cannot be justly overlooked. While these may be of only minor importance in connection with the hydraulic gravel beds of the Oroville district and the remains of the placer mines there, they certainly are of very grave moment in some of the other districts which have been mentioned above, as representing the fields in which dredging activities are being carried out. For example, the beautiful shores of the American River, along which are to be found some of the most picturesque and pleasing views in the State, are in certain portions being converted into the desolate condition of a wide expanse of cobblestone hills of irregular height. The same is also true of other sections of the areas now being dredged in the State. The citizens of California, and for that matter of this country, are not justified in allowing, without restraint or hindrance, the disfigurement of a large acreage of land, even though that land may have no large financial value as compared with the total amount of wealth obtained through dredging it. It is my point of view, however unjustified it may be, that anything that contributes to the natural beauties of this State should be as much entitled to the shielding influence of conservation as these things which contribute to her material wealth. I mention this here, because not only a considerable acreage of country has already been disfigured by the dredging but because I anticipate the possibility of such large acreages in the future being similarly made desolate through the same industry. The question naturally arises, "Where shall we stop the process of desolation and can we stop a portion of it if the rest be allowed to go on?" These questions must have definite answer from those who are looking forward to the future policy of the State in such matters.

GENERAL REMARKS.

Without assuming in any way the attitude of the extremist in conservation matters and looking at this question of the dredged lands in California from the broadest possible point of view, including the agricultural, I cannot see how I can come to any other conclusion than that dredging of land in this State, in the final analysis, is, and must continue to be, a distinct detriment to the agriculture of the



Young eucalyptus trees planted on lands of the Natomas Company.



Young trees as they look a year or two after planting.

State, to say nothing of the other phases of the question above considered; this, despite the fact that the full recognition is given to the various arguments put forth that the large amount of wealth obtained through dredging per acre may give larger returns than the same lands agriculturally managed may give to many generations of farmers. Further than that, it is impossible at the present time to say whether or not the reclamation of these dredged lands will be possible in such a manner as to make them sources of income to average farmers. While with the attitude of the scientific man, I cannot deny that the possibility, and even the probability, of this condition may exist, I cannot help but entertain some grave doubts with reference to the matter.

It is true that large acreages of land so far dredged have been agriculturally valueless and to that extent the dredging companies have not seriously injured the agriculture of California. It is true, moreover, that large acreages of the land thus far dredged were, prior to dredging, in such condition that the further operations of the dredger did not seriously change the appearance of the country. It is also true that an enormous amount of wealth is being annually taken out of the dredged fields which may represent, in some cases, far larger amounts of money than those fields will yield, agriculturally, in a century, or more, to come. It is true that some attempts are being made by the dredging companies to reclaim that land by planting to eucalyptus and olives.

But, opposed to all these facts, it is likewise true that if an effort is not made to check the progress of the dredging companies, such large acreages as they will ultimately work are bound to include not only valueless land, but also very valuable land. It is also to be opposed to the second truthful claim of the dredging companies that, while in the past, large acreages of land turned up have not in any way changed or disfigured the country, that at the present time, and still more largely in the future, large acreages turned up by the dredgers will greatly disfigure and make valueless and desolate some of the beautiful parts of our State. While it may be that the total amount of wealth obtained from each acre of dredged land may be far in excess of what many generations of farmers may take out on the same land, agriculturally worked, I cannot see how this generation has a right to rob the coming generations of lands which otherwise might be made in the future to support a very considerable population. Besides, the money which is obtained through dredging does not necessarily come into circulation and probably, usually, does not do so in such a manner as to constitute a permanent source of wealth for the inhabitants of the State. The capital obtained through dredging the lands, at the present time, remains largely centered in a few hands and will more than likely remain in the hands of a few; whereas, agricultural land will continue to be a source of income to a local population much larger in number than the few benefited by the dredging for a longer number of years, even if all other features are not considered. While the most valid objection to the campaign against dredging by the dredging companies may be that the dredged land can be reclaimed, the instances cited above with reference to such attempts at reclamation are not to my mind evidence conclusive enough to make the matter practicable and assuredly profitable. In the absence of better evidence than we have on this subject, I think that we can justly consider the results thus far obtained on the reclamation of dredged lands as an argument in favor of the opposition to the dredging companies.

Accompanying my report, I am submitting a series of photographs taken by Mr. Frank Adams, who was with me on my visits to Oroville and Folsom, which show the conditions of the dredged lands and the efforts at reclamation being made. They will help to give an idea as to the appearance of the country in which the dredging operations are being carried on.

Respectfully submitted.

CHAS. B. LIPMAN.

EXHIBIT F.

California State Board of Forestry, Sacramento, May 15, 1912.

Conservation Commission, 702 Mills Building, San Francisco, California.

Gentlemen: I enclose for your information, the first installment of data collected on forest taxation in California. This is the first time that material of this character has been assembled. Although the figures are estimated, they are just as accurate as can be obtained without handling each tax receipt for the several counties. It is impossible to get them exact at this time because the work is very expensive. The counties have never compiled this information but I believe the figures to be pretty close and will serve as a guide in determining what effect a proper tax on yield would have on the income of these counties dependent chiefly upon revenue derived from timber taxation. It will be necessary, as soon as funds are available, to secure, in addition to the lowest and highest rate for timber land and cut-over land, the percentage of the area assessed at the various rates. This means again, the handling of each tax receipt which is a more expensive piece of work than could be undertaken at present. These figures are sufficient, at least, to show the need for some adjustment in the application of the present method, that there may be a more uniform basis for assessment of similar timber land equally accessible or inaccessible.

There will be sent to you, as soon as it can be type-written, a summary of what other states are doing, showing briefly, existing laws; which states have made studies of forest taxation, and those where studies are being contemplated; together with an alphabetical list of owners showing the assessed amount, by acres, of timber land and cut-over land, by counties, and the total. Fire data is in the course of preparation and will be gotten out as soon as possible.

Yours very truly,

G. M. Homans,
State Forester.

*Big tree tracts are assessed for $80.00, other timber land for $10.00.

FOREST TAXATION BY COUNTIES.

Alameda County.

There is no timber land in Alameda County. The assessor estimates that from 85 to 90 per cent of the total tax is received from incorporated cities. An actual examination of the land is made annually. In assessing orchard land, the fruit trees are not separated from the land. The assessed value of lands ranges from $4.00 to $600.00 per acre. The assessor estimates that these assessed values represent 60 per cent of the actual value. There are no regular rules for assessing. A raise is expected in assessed values this year. The tax rate in 1911 was $1.34 per $100.00 on land outside of the cities. There are no sawmills in the county.

Alpine County.

There is only a small area of timber land in this county (6,033 acres). In assessing, the trees are not separated from the land. No cruises are made. The assessed value of the timber land is $3.00 per acre, and of the farm land $12.00 to $30.00 per acre. The tax rate in 1911 was $2.00 per $100.00. No raise in values is expected. There is one small sawmill in the county. The largest proportion of the total tax is contributed by the farming land.

Amador County.

This county has considerable timber land. No cruises are made and the work is not systematized. The trees are not separated from the land. Timber land is assessed at $7.50 per acre, cut-over land at $2.50 to $3.00 per acre, and grazing land at $2.00 to $3.00 per acre. The tax rate on land outside of cities was $2.20 per $100.00 in 1911. The assessor estimates that the assessed value equals about 60 per cent of the actual value. An increase in the assessed values was made in 1911. The assessor is in favor of having the timber cruised.

Butte County.

This county has considerable timber land. An actual examination of the greater part is made annually, and part of the land is cruised by the deputy assessor. The timber land is divided into three classes, the first being assessed at $8.00 to $10.00 per acre, the second at $5.00 to $7.00 per acre, and the third at $2.50 to $6.00 per acre. Cut-over land is assessed at $1.25 to $2.50 per acre. The tax rate in 1911 was $2.30 per $100.00. The average actual value of the timber land was estimated to be about $24.00 per acre. There are no plans for reform in this county and the people are well satisfied with the present method of taxation.

Calaveras County.

There is considerable timber land in this county. The trees are not separated from the land, and no cruises are made. There is some talk of hiring a cruiser, but the county is afraid of the cost. The tax rate was $2.05 per $100.00 in 1911. The assessed value of timber land is $10.00 per acre, of cut-over land $1.25 to $4.00 per acre, and chaparral land $2.50 to $5.00 per acre. The actual values are represented at $8.00 to $20.00 per acre.

Contra Costa County.

There is no timber land in this county. The largest proportion of the total county tax is contributed by manufacturing corporations. An actual examination of the land is made annually. In taxing orchard land, the fruit trees are separated from the land. The tax rate was $1.50 per $100.00 in 1911. The average assessed value of the ranch land is estimated to be $35.00 per acre, of chaparral land $3.00 to $6.00 per acre, and of fruit trees $20.00 to $40.00 per acre. The assessor estimates the assessed value to be 60 per cent of the actual value. There are no sawmills in the county.

Del Norte County.

This county has a comparatively large area of timber land. Neither an actual examination nor a cruise of the timber is made. The assessed valuations have been raised about 60 per cent since 1906. In determining the assessed values, the trees are not separated from the land. The timber land is assessed at $20.00 to $67.50 per acre, and the average assessed value for spruce being $20.00 per acre, and for redwood about $35.00 per acre. It is estimated that 75 to 80 per cent of the total county tax comes from the timber lands. There are no plans of reform. Cut-over land is assessed at $3.00 to $5.00 per acre. The tax rate was $1.75 per $100.00 in 1911.

El Dorado County.

There is considerable timber land in this county. The county has no ownership of plats and shows a great lack of system. The trees are not separated from the land. No examinations or cruises are made. The timber land is assessed at $10.00 per acre, which is a great increase over 1910. The cut-over land is assessed at $2.00 per acre and the chaparral land at $2.50 to $5.00 per acre. The tax rate was $2.00 per $100.00 in 1911. The assessor estimates that the assessed value equals 50 to 60 per cent of the actual value. The general sentiment in the county is in favor of securing a better knowledge of the timber resources. There are no sawmills in this county.

Fresno County.

This county has a small area of timber land. No cruises or actual examinations are made of the timber land, and the trees are not separated from the land. The timber is divided into two classes, the first being assessed at $12.50 per acre and the second at $8.00 per acre. The tax rate was $1.64 per $100.00 in 1911. Cut-over and chaparral lands are assessed at $1.50 per acre. The actual value of timber land was estimated to be about $50.00 per acre. No plans of reform are being discussed, but the assessor is thinking of raising the assessed values.

Glenn County.

This county has a small area of timber land. No cruises are made and the trees are assessed at $2.00, $3.00, $4.00, $5.00, $6.00, $8.00, and $10.00 per acre. Cut-over land is assessed at $2.00 per acre and the chaparral land at $2.00 and $3.00 per acre. The assessor estimates that the assessed value represents 60 per cent of the actual value. The tax rate in 1911 was $1.82 per $100.00, depending upon the school district. There was no talk of reform.

Humboldt County.

This county has a large area of timber land. No cruises are made and the trees are not separated from the land. Redwood land is assessed at $15.00 to $60.00 per acre, pine and tan bark oak land at $2.00 to $10.00 per acre. Cut-over land is assessed at $4.00 to $6.00 per acre. The assessor estimates that the assessed value equals about 50 per cent of the actual value, and that about 40 per cent of the total county tax was derived from timber land. The tax rate in 1911 was $1.90 per $100.00. The general sentiment of the county was in favor of cruising if it would not be too expensive.

Inyo County.

There is no timber land in Inyo County. The sage brush land is valued at about $3.00 per acre and the farm land up to $100.00 per acre. The assessor estimates the assessed value to be about 60 per cent of the actual value. The tax rate in 1911 was $2.00 per $100.00. There are no sawmills in the county.

Kern County.

There is very little timber land in Kern County, and what is found is assessed at $1.33 per acre. Cut-over land is assessed at $2.00 to $12.00 per acre. The actual value of the timber land was estimated to be $2.75 to $3.00 per acre. No cruises are made. The tax rate in 1911 was $1.20 per $100. There is one sawmill in Kern County.

Kings County.

Kings County has no timber land. The grazing land is assessed at $2.50 per acre. The principal revenue of the county comes from the fruit lands. The fruit trees are assessed separately. Fruit and farm land is assessed at $40.00 to $100.00 per acre. The tax rate in 1911 was $1.65 per $100.00. There are no sawmills in the county.

Lake County.

This county is mostly agricultural and has very little timber land. No examinations and no cruises are made of the timber land and the trees are not assessed separately. Timber land is assessed at $3.00 to $4.00 per acre, cut-over land at $2.00 to $2.50 per acre and chaparral land at $1.25 per acre. The tax rate in 1911 was $2.15 per $100.00. It was estimated that the timber land was actually worth $7.00 to $9.00 per acre. The assessor contemplates raising all the assessed values in the county.

Lassen County.

This county has a large area of timber land. In 1905, this was cruised and classified by an expert cruiser. The timber land was divided into four classes, class A being assessed at $12.50 per acre, class B at $7.50 per acre, class C at $5.00 per acre, and class D at $2.50 per acre. The cut-over land is assessed at $2.00 per acre and the chaparral at $2.00 to $3.00 per acre. The assessor estimates that the assessed values represent about 30 per cent of the actual value. The timber land is recorded on separate plats. It was estimated that about 25 per cent of the total county tax was derived from the timber land. The assessor is contemplating raising the assessed values of the timber land. There was a flat rate of $2.50 per acre on the timber land in Lassen County previous to the cruises.

Los Angeles County.

There is no timber land in this county. In 1911 the tax rate was $1.20 per $100.00. The assessor estimates that the assessed values represent 25 to 40 per cent of the actual values. The fruit trees are assessed separately. There are no sawmills in the county. Chaparral land is assessed at $8.00 to $100.00 per acre, and fruit land up to $600.00 per acre.

Madera County.

This county has a rather small area of timber land. No cruises are made and the trees are not separated from the land. In 1911 the tax rate was $2.30 per $100.00. The assessed value of timber land was $10.00 per acre (will be $15.00 in 1912), of cut-over land was $1.50 per acre (will be $2.50 in 1912), and of chaparral $1.50 per acre. The assessor estimates that the assessed values represented 50 per cent of the actual value.

Marin County.

The timbered area in this county is small. There are no sawmills in the county. Cruises are not made and the trees are not separated. In 1911 the tax rate was $1.55 per $100.00. The assessed value of timber land was about $9.00 per acre and for cut-over land about the same. No plans of reform were being discussed.

Mariposa County.

There is considerable timber land in this county. No cruises are made, but examinations are made at irregular intervals. The trees are not assessed separately. The timber land is divided into two classes for assessment purposes, the first being assessed at $25.00 per acre and the second at $12.50 per acre. Cut-over land is assessed at $3.50 per acre and chaparral at $3.50 to $4.00 per acre. In 1911, the tax rate was $1.70 per $100.00. It was estimated that the actual value of the timber land was about $50.00 per acre. The assessed values were raised in 1911. The assessor estimates that 25 per cent of the total county tax was derived from timber land. There were no plans of reform in this county.

Mendocino County.

The timbered area in Mendocino County is very large. No cruises and no actual examinations are made and the trees are not assessed separately. The timber land is assessed at about $10.00 per acre, the chaparral land at $2.50 per acre, and the cut-over land at $2.50 per acre. In 1911 the tax rate was $2.14 per $100.00. It was estimated that the actual value of the timber land ranged from $10.00 to $100.00 per acre. No change has been made in the assessed values for nearly ten years. The timber lands probably contribute about 50 per cent of the total county tax. The general sentiment is in favor of raising the assessed values.

Merced County.

There is no timber land in Merced County. Grazing land is assessed at $4.00 per acre, and farm land at $10.00 to $100.00 per acre, and chaparral land at $1.25 to $2.50 per acre. In 1911 the tax rate was $2.15 per $100.00. There are no sawmills in the county.

Modoc County.

There is a large area of timber land in this county. A cruise of the timber was made by the county surveyor in 1908 and 1909; it was divided, for assessment purposes, into three classes. Class A is assessed at $12.00 per acre, class B at $8.50 per acre, and class C at $5.00 per acre. Cut-over land is assessed at $2.00 to $2.50 per acre. The timber lands are recorded in a separate plat book, showing the class in which each subdivision belongs. Before this cruise was made, there was a flat rate of $2.50 per acre on all timber land. It was estimated that the actual value of the timber land is from $10.00 to $50.00 per acre The assessor estimated about 33 per cent of the total county tax is derived from the timber land. In 1911, the tax rate was $1.60 per $100.00. The people of this county are well satisfied with the present system of taxation.

Mono County.

The timbered area in this county is small. No cruises are made and the trees are not assessed separately. Examinations are made very irregularly. The timber land is assessed at $2.50 to $3.00 per acre and the cut-over land at $1.50 to $2.00 per acre. The tax rate was $2.00 per $100.00 in 1911. The largest proportion of the county tax is derived from the grazing and farm land. The supervisors do not favor an increase in assessed values.

Monterey County.

This county has a rather small area of timber land. No cruises are made and the trees are not assessed separately. No actual examinations are made and there is a great lack of system in assessing the timber land. The timber, cut-over and chaparral lands are all assessed as grazing land at $1.25 to $4.00 per acre. The assessor estimated that the assessed values represented 45 per cent of the actual value Fruit land is assessed at $15.00 to $225.00 per acre. There are no sawmills in the county.

Napa County.

There is no timber land in this county. The principal tax revenue comes from the ranch land. The fruit trees are not assessed separately. Examinations of the land are made annually. Ranch and fruit land is assessed at $25.00 to $300.00 per acre, and chaparral land, which is used for grazing, at $2.00 to $5.00 per acre. The assessor estimated that the assessed value represents 50 to 60 per cent of the actual value. The tax rate was $1.76 per $100.00 in 1911. There are no sawmills in the county.

Nevada County.

The timbered area is rather small. No cruises are made and examinations are made at irregular intervals. The trees are not assessed separately. Timber land is assessed at $2.00 to $5.00 per acre, cut-over land at $1.00 per acre, and chaparral, which is used for grazing, up to $10.00 per acre. The assessor estimates that this represents about 60 per cent of the actual value. The tax rate in 1911 was $2.50 per $100.00. There were no plans for reform.

Orange County.

There is very little timber land in this county. The trees are assessed separately. The tax rate was $1.50 per $100.00 in 1911. The principal revenue comes from the orange and walnut groves. Timber land is assessed at $17.68 per acre, and the trees at $23.32 per acre. Fruit land is assessed at $25.00 to $225.00 per acre and the fruit trees at $50.00 to $225.00 per acre. Grazing land is assessed at about $5.00 per acre. The assessor estimates that the assessed value represents 30 per cent of the actual value. There are no sawmills in the county.

Placer County.

This county has a large area of timber land. No examinations are made, but the trees are assessed separately. The timber land is assessed at a flat rate of $1.00 per acre and the trees are assessed $3.00, $4.00, or $5.00 in addition. Cut-over land is assessed at $1.00 per acre and chaparral or grazing land at $4.00 to $10.00 per acre. It was estimated that the actual value of the timber land was $20.00 to $30.00 per acre. About 15 per cent of the total county tax is derived from the timber land. In 1911, the tax rate was $2.25 per $100.00. The assessor favors cruising, but the Board of Supervisors voted against this proposition.

Plumas County.

There is a large area of timber land in this county. No examinations and no cruises are made, but the valuations are raised from year to year. The timber land is assessed at $8.00, $10.00 and $12.00 per acre, chaparral land at $2.00 to $2.50 per acre and cut-over land at $2.00 per acre. The tax rate in 1911 varied from $1.65 to $2.80 per $100.00 depending upon the school district. The actual value of the timber land ranges from about $20.00 to $50.00 per acre. The assessor estimated that 65 per cent of the total tax was derived from timber land, 2 per cent from chaparral land, and about 1 per cent from the cut-over land. The present system is unsatisfactory and cruising the timber is being advocated.

Riverside County.

The timbered area in this county is small. The principal tax revenue comes from the fruit land. A four-year-old grove is assessed at $60.00 per acre and this is increased $30.00 per acre annually until $225.00 per acre is reached. The land and water rights are assessed separately, and the maximum valuation for the three is $500.00 per acre. The tax rate was $2.10 per $100.00 in 1911, exclusive of bonded school tax. Timber and grazing land are not separated and no examinations of them are made. The assessor estimated that the assessed values represent about 30 per cent of the actual values. The present methods of taxation are unsatisfactory.

Sacramento County.

There is no timber or cut-over land in this county. An actual examination of all the land is made annually. Regular rules for assessing are in vogue. The tax rate was $1.69 per $100.00 in 1911, on land outside of cities. The assessor estimates that the assessed values represent 60 per cent of the actual value. Grazing land is assessed at $5.00 per acre, fruit and ranch lands at $15.00 to $500.00 per acre, and dredging land at $150.00 to $750.00 per acre. No plans of reform are being discussed. There are no sawmills in the county.

San Benito County.

There is very little timber land, but a great area of chaparral land in this county. In 1911, the tax rate was $1.70 per $100.00. Chaparral land is assessed at $1.00 to $2.50 per acre, cut-over land at $1.50 per acre, fruit land at $120.00 per acre, and fruit trees at $50.00 per acre. No actual examinations are made. The assessor estimates that the assessed value represents 45 per cent of the actual value. There are no sawmills in this county.

San Bernardino County.

The timbered area in this county is small, and the fruit land is the principal source of revenue. No cruises are made but the values are raised annually to allow for growth. Timber land is assessed at $2.25 to $7.50 per acre, cut-over land at $2.00 to $3.00 per acre, fruit land at $100.00 to $350.00 per acre, and fruit trees at $20.00 to $200.00 per acre. The assessor estimates that the assessed values represent 30 per cent of the actual value. The general sentiment is that the tax rate is too high and plans for reform are being discussed. In 1911, the tax rate was $2.50 per $100.00.

San Diego County.

This county has a small area of timber land, but the principal revenue comes from the fruit land. The tax rate was $2.00 per $100.00 in 1911. The forest trees are not assessed separately. The timber land is assessed at about $1.50 per acre, chaparral land at $3.00 to $5.00 per acre and fruit trees at 30 cents per tree. The assessor estimates the assessed value to be 30 per cent of the actual value. There is one small sawmill in the county.

San Joaquin County.

There is no timber land in this county, and the greater part of the revenue is contributed by the farm land. Ranch land is assessed at $10.00 to $300.00 and up to $1,000.00 per acre, in a few cases. Grazing or chaparral land is assessed at about $3.00 per acre. The assessor estimates the assessed values to be about 50 per cent of the actual values. There are no sawmills in the county.

San Luis Obispo County.

There is very little timber in this county. Apple and walnut lands are assessed at about $200.00 per acre for walnut land and $6.00 to $8.00 per acre for apple land. The assessor estimates the assessed values to be 25 per cent of the actual value. The tax rate in 1911 was $2.11 per $100.00. Chaparral and oak land is classified as grazing land and assessed $1.25 per acre. There are no plans for reform and no sawmills in the county.

San Mateo County.

There is a small area of timber land in this county. No cruises and no examinations are made. Timber land is assessed at $8.00 to $12.00 per acre, cut-over land at $2.00 to $5.00 per acre, and chaparral land at $2.00 to $50.00 per acre. The tax rate in 1911 was $1.85 per $100.00. No plans of reform were being discussed. There are four sawmills in the county.

Santa Barbara County.

There is no timber in this county, but there is a big area of chaparral land, which is assessed at $1.25 and $1.30 per acre. The tax rate was $2.34 and $2.74 per $100.00 in 1911. The general sentiment is that the present system is satisfactory.

Santa Clara County.

There is no timber land, but a great deal of chaparral land in this county which is assessed at $1.50 to $5.00 and up to $10.00 per acre in some cases. The tax rate in 1911 was $1.35 per $100.00. There are no sawmills in this county and no plans for reform.

Santa Cruz County.

Two thirds of the timber land in this county has been cut-over and is now considered as chaparral land. In 1911, the tax rate was $2.10 per $100.00. Chaparral land is assessed at $2.00 to $5.00 per acre, cut-over land at $5.00 to $8.00 per acre, timber land at $10.00 to $50.00 per acre, fruit land $50.00 to $200.00 per acre, and 25 cents to $1.75 each for fruit trees. The assessor estimates that the assessed value represents about 45 per cent of the actual value. No examinations and no cruises are made. The general opinion is that the assessed values of the timber land are too high. There are four sawmills in the county.

Shasta County.

There is a large area of timber land in this county. Examinations are made at irregular intervals and some cruising is done. The trees are not assessed separately. The timber land is divided into four classes which are assessed as follows: Class 1 at $10.00 per acre; class 2 at $8.00 per acre; class 3 at $5.00 per acre, and class 4, which is cut-over land, at 50 cents per acre. Chaparral land is assessed at $1.25 to $2.50 per acre. It was estimated that 25 per cent of the total county tax is derived from the timber land and 8 to 10 per cent from the chaparral and grazing land. The actual value of the timber land ranges from about $16.00 to $60.00 per acre. The tax rate was $2.24 per $100.00 in 1911. The assessor is in favor of cruising the timber.

Sierra County.

The area of timber land in this county is large. No cruises are made and actual examinations are only made in case of doubt. The trees are not assessed separately. Timber land is assessed at $2.50 to $6.00 per acre and cut-over land at $1.00 per acre. Proportional reductions are made when part of an area is cut over. The tax rate was $2.00 per $100.00 in 1911. It was estimated that the average actual value of the timber land is about $25.00 per acre and of the cut-over land about $2.50 per acre. No plans for reform were being discussed.

Siskiyou County.

There is a very large area of timber land in this county. The trees are not assessed separately and neither cruises nor actual examinations are made. Timber land is assessed according to accessibility at $6.00 and $7.00 per acre, and cut-over land at $1.00 per acre. In 1911 the tax rate was $2.00 per $100.00. It was estimated that 65 per cent of the total tax is derived from timber land, 15 per cent from chaparral, desert and grazing land, and 5 per cent from the cut-over land. Chaparral land is assessed at $2.50 per acre. The general sentiment favors cruising. There are fifty-two sawmills in this county.

Solano County.

There is no timber land in this county. The principal tax revenue comes from the fruit and ranch land. An actual examination is made each year. The tax rate in 1911 was $1.60 per $100.00. Land is assessed at $10.00 to $300.00 per acre, and fruit trees at $40.00 per acre. The assessor estimates that the assessed values represent 60 to 70 per cent of the actual values. There are no sawmills in the county and no plans for reform.

Sonoma County.

There is a large area of timber land in this county. No cruises are made and the trees are not assessed separately. An actual examination is made every four years. The oak land is assessed at $3.00 per acre, redwood at $8.00 to $50.00 per acre, cut-over land at $4.00 to $5.00 per acre and chaparral at $2.00 per acre. The assessor estimates that the assessed values represent 30 to 50 per cent of the actual value, and believes this to be high enough. In 1911, the tax rate was $1.60 per $100.00. The principal revenue in this county comes from farm land.

Stanislaus County.

There is no timber land in this county, also there are no sawmills. The principal tax revenue comes from ranch lands. The tax rate was $1.85 per $100.00 in 1911.

Sutter County.

There is no timber land in this county, also no sawmills. Examinations of the land are made yearly. Pasture land is assessed at $2.50 to $10.00 per acre. The tax rate in 1911 was $1.50 per $100.00. The present system of taxation is satisfactory to the people.

Tehama County.

This county has a large area of timber land. No cruises nor examinations are made and the trees are not assessed separately. The timber land is divided into four classes, which are assessed as follows: Class 1 at $3.00 per acre; class 2 at $5.00 per acre; class 3 at $8.00 per acre, and class 4 at $10.00 per acre. Cut-over land is assessed at 50 cents to $2.00 per acre, and chaparral at $1.50 to $2.50 per acre. The average actual value of the timber land is estimated to be about $19.00 per acre. The people seem fairly satisfied with the present methods, but the general sentiment favors cruising.

Trinity County.

This county has a large area of timber land. No cruises and no examinations are made. The trees are not assessed separately. Timber land is assessed at $5.00, $8.00 and $10.00 per acre, very poor timber land is assessed at $2.50 and $3.00 per acre, cut-over land at $1.00 per acre and chaparral at $1.00 to $1.50 per acre. The actual value of the timber land is estimated to be from $10.00 to $20.00 per acre. In 1911 the tax rate was $2.60 per $100.00. The assessor estimates that the timber land contributes 50 per cent and the chaparral land 10 per cent of the total tax. The general sentiment of the county is in favor of cruising.

Tulare County.

This county has a rather large area of timber land. The trees are not assessed separately. No examinations and no cruises are made. Timber land is assessed at $2.50 to $30.00 per acre, cut-over land at $1.50 per acre and grazing and chaparral land at $2.50 per acre. The assessor estimates the assessed values to be about 50 per cent of the actual value. The tax rate was $1.70 per $100.00 in 1911. There were no plans for reform.

Tuolumne County.

There is a rather large area of timber land in this county. No cruises or examinations are made. The trees are not assessed separately. Ordinary timber land is assessed at $10.00 per acre. ''Big Tree'' tracts at $80.00 per acre, cut-over land at $2.00 per acre, and chaparral land at $1.25 to $3.25 per acre. The actual value of the ordinary timber land is estimated to be about $18.00 per acre. The tax rate in 1911 was $1.95 per $100.00. There were no plans for reform.

Ventura County.

There is very little timber land in this county. Most of the revenue comes from the fruit lands. Fruit land is assessed at $250.00 to $300.00 per acre, and fruit trees at $1.00, $2.00, and up to $4.00 each. The tax rate in 1911 was $1.70 per $100.00. The timber is only used locally and there is no systematic method for determining the valuation of timber land.

Yuba County.

This county has considerable timber land. No cruises and no examinations are made, but the assessed values are determined by the general knowledge of the assessor. Timber land is assessed at $5.00 per acre, cut-over land at $2.00 per acre, and chaparral and grazing land at $2.00 per acre. The tax rate in 1911 was $2.40 per $100.00. There were no plans for reform.

REPORT

OF THE

State Water Commission

OF

CALIFORNIA

1912

FRIEND WM. RICHARDSON, SUPERINTENDENT OF STATE PRINTING
SACRAMENTO, CALIFORNIA
1912

REPORT OF THE STATE WATER COMMISSION OF CALIFORNIA.

SACRAMENTO, CALIFORNIA.

To his Excellency, the Governor, State of California.

SIR: In compliance with the provisions of Chapter 41, Statutes of 1911, creating and establishing this Commission, we have the honor to submit a report of the work performed from March 24 to November 1, 1912.

Respectfully submitted this first day of January, 1913.

STATE WATER COMMISSION,

CHARLES D. MARX, Chairman.

LOUIS R. GLAVIS, Secretary.

STATE WATER COMMISSION.

COMMISSIONERS.

HIRAM W. JOHNSON, *Governor*	Sacramento, California.
CHARLES D. MARX, *Chairman*	Palo Alto, California.
S. C. GRAHAM	Los Angeles, California.
HAROLD T. POWER	East Auburn, California.
W. F. McCLURE	Sacramento, California.
LOUIS R. GLAVIS, *Secretary*	San Francisco, California.

REPORT

This Commission assumed its duties on March 24, 1912, having succeeded the State Board of Control, Water Power, created under the provisions of Chapter 406, Statutes of 1911. The State Board of Control, Water Power, was organized May 4, 1911, and since its records were delivered to us, we shall briefly outline the nature of the work performed by it during the nine months of its existence.

The applications received by the Board for permits to appropriate the public waters of the State for power purposes were as follows:

North Fork American River	2
Bishop Creek	2
Bull Creek	1
Butano Creek	1
Cache Creek	2
Coffee Creek	1
Cottonwood Creek	1
Coyote Creek	1
Fall River	1
Feather River	6
Merced River	1
Mountain Home Stream	1
North Cañon	1
North Eel River	1
Owens River	1
Peavine Ravine	1
San Joaquin River	1
Smith River	2
Taylor Creek	1
Trinity River	1
Truckee River	2
Ward Creek	1

The fees collected by the Board of Control, Water Power, and deposited with the Controller, amounted to $310.00. An appropriation of $50,000.00 was made for the purpose of carrying out the provisions of the act creating the Board of Control, Water Power. The sum of $37,083.79 still remained unexpended when the present Commission succeeded the Board of Control, which was in existence for nine months. The sum of $12,916.21 was therefore expended by the latter.

The Board of Control, Water Power, made a complete record of all water filings for power purposes on each and every stream in the State of California. Examinations by the engineers of the Board disclosed the fact that fully ninety per cent of the filings made in accordance with the old method of the location of water filings were not made in good faith, and that practically nothing whatever had been done by these water claimants towards the development of the streams on which they had filed.

Many of these speculative filings have been the cause of much litigation, because when attempt is made by *bona fide* claimants to actually develop water power, they are compelled either to buy off the speculator or have his filing declared by the courts to be invalid. Judicial proceedings are expensive and naturally require much time before being finally determined, hence, in order to avoid delay, a person desiring to really make a power development usually purchases the mere water rights of the speculator. Since capitalists are loth to invest where they are immediately confronted with expensive litigation they become discouraged and indignant, so that the project is abandoned, and as a result the water not only continues to remain unused, but also the State's commercial progress is retarded and many are deprived of the employment and benefits that necessarily arise in the development of water power. Under the law creating this Commission speculative filings are impossible. Persons desiring the use of water for the generation of electricity or other power, must make application to this Commission setting forth the point where the water is to be diverted from the stream; the point where it is to be returned to the stream; the amount of water desired; the amount of water to be developed and the purpose for which it will be used. The Commission upon receipt of an application causes an investigation to be made to determine whether the applicant is in good faith; whether the greatest development of the stream can be secured by the diversion of the water at the point mentioned, and whether the issuance of a permit would tend to injure any existing vested water right. After such investigation is concluded, a public hearing is held where any one interested may appear for or against the allowance of the application. The witnesses who appear are sworn and their testimony taken. With this testimony and the civil engineer's report the Commission is in possession of sufficient data to decide whether or not the granting of a permit to the applicant will be to the best interests of the State.

Since March 24, 1912, to November 1, 1912, this Commission has received thirty-three applications for permits to appropriate the public waters of the State for power purposes. The following is a list of such applications:

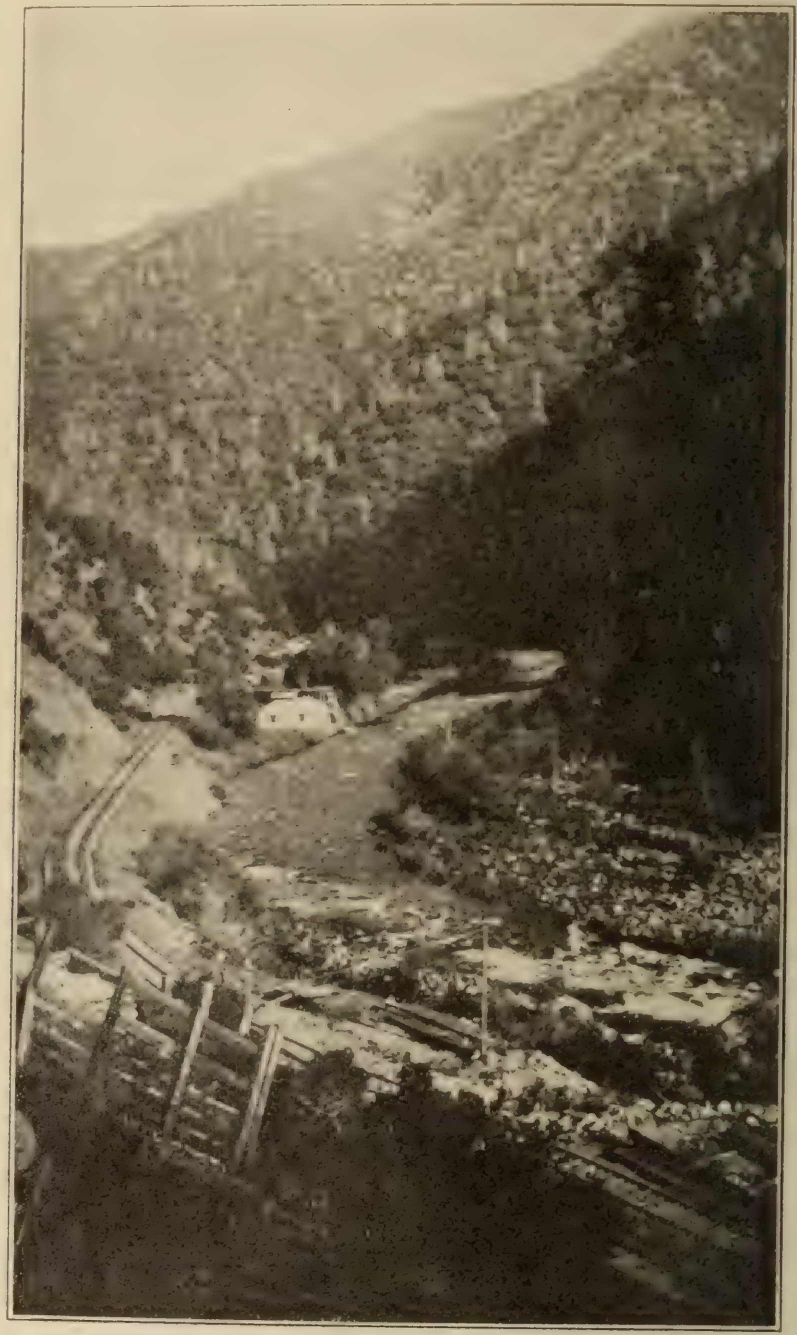
American River	1
Big Creek	1
Big Pine	2
Big Sur River	2
Big Tujunga River	1
Bull Creek	1
Butano Creek	1
Coffee Creek	1
Coyote Creek	1
Deer Creek	1
Fall River	1
Feather River	2
Goodale Creek	1
Hamlin Creek	1
Little Rock Creek	1
Merced River	1
Mountain Home Stream	1
North Eel River	1
Rawson Creek	1
San Joaquin River	3

Silver Cañon Creek	1
Smith River	1
South Fork Smith River	1
Trinity River	1
Truckee River	1
Volcano Canyon	1
Weaver Lake	1
West Branch, North Fork, Yuba River	1
North Branch, West Branch of North Fork, Yuba River	1
Total	34

Of these applications seven have been canceled, either on account of the abandonment of the application by the person filing it, or because after careful and diligent consideration of the testimony introduced at the public hearing, it was deemed in the interest of the State that they be ordered canceled. Permits have issued for fourteen applications. The developments under the applications approved called for a total expenditure of $6,125,325.00 and the theoretical horsepower capable of development under these permits amounts to 132,648 horsepower. Of the applicants holding permits for the development of water power, one has already completed the construction of his plant and license has issued. Under the terms of such license the State will receive an annual revenue of ten cents for each theoretical horsepower capable of development under the works as constructed.

The federal law relating to the disposition of water power sites on the public domain has been proven totally inadequate. It provides for a permit to use the right of way for the occupancy of the public lands, and for the occupancy of certain National Reserves—a mere license—revocable at the discretion of the head of the federal department who granted it. The power of revocation without compensation has caused great alarm in the eyes of capital, and rightfully. The Government officials, favoring permits that contain the right of revocation by the Secretary of the Department, defend their position upon the ground that such powers of revocation would not be exercised without justification. The confidence that the power to revoke permits would not be abused by the head of the Department was dispelled by the action of a former Secretary of the Interior in calling upon the city of San Francisco (which had been granted a permit under the act for its municipal supply in the Hetch Hetchy), *to show cause why the permit should not be canceled.* This action was taken regardless of the fact that the city of San Francisco had complied with all the terms of the permits. The Department of Agriculture in administering National Forests offers no better encouragement to the person desiring to conserve and develop the waters. As a result, development has been very greatly retarded in the public land states.

For a number of years there have been pending before congress, bills concerning the occupation and use of certain portions of the public domain for water power purposes. It is universally admitted that the present legislation, consisting principally of the act of February 15, 1901, is entirely inadequate to satisfy the present popular sentiment, to encourage persons and corporations engaged in the occupation of generating electric power, or to protect consumers in the various states, all of whom have the right to demand the immediate cessation of the present enormous waste.



The plant of the Original Milling and Mining Company, on the Merced River. This Commission has issued a license to the above company.

The legislation proposed on this subject has assumed various forms, according to the individual prejudice of the person from whom it emanated. The urgency of proper legislation is everywhere admitted and so far no bill has found sufficient support to be passed by congress. This Commission, in coöperation with the Conservation Commission, believing that certain matters of State interests and expediency have not been given a full consideration in the federal water power bills introduced by congress, has arranged for a conference with the Secretary of the Interior to be held in Washington, D. C., on November 18th, for the purpose of presenting the conditions as they actually exist in this State, and the hardships that one is confronted with in the effort to develop our streams for power purposes.

A view of the San Joaquin River, just before it debouches from the foothills. Quite a few notices of water locations have been posted here, but no means of diversion have ever been constructed.

We believe that immediate action should be taken by this State to protect its interest in the waters of Lake Tahoe, and therefore recommend the institution of a suit against the State of Nevada in the United States Supreme Court for the purpose of having the waters of Lake Tahoe and the Truckee River duly apportioned in accordance with the decision of the *Kansas* vs. *Colorado* case. In addition to the bringing of this suit, we believe that complaint on behalf of the State should also be filed against the Truckee General Electric Company, to restrain it from storing the flood waters of the lake. The importance and necessity of instituting these suits cannot be too strongly emphasized in order that the rights of the State of California may be fully protected.

Under a coöperative agreement entered into with the United States Geological Survey, there has been prepared a complete digest of all available data concerning the flow of streams in this State. This information is contained in Water Supply Papers, Nos. 295, 296, 297, 298, 299, 300. Copies of these publications are available to the public, and may be secured upon application to the United States Geological Survey, Washington, D. C., or to this office.

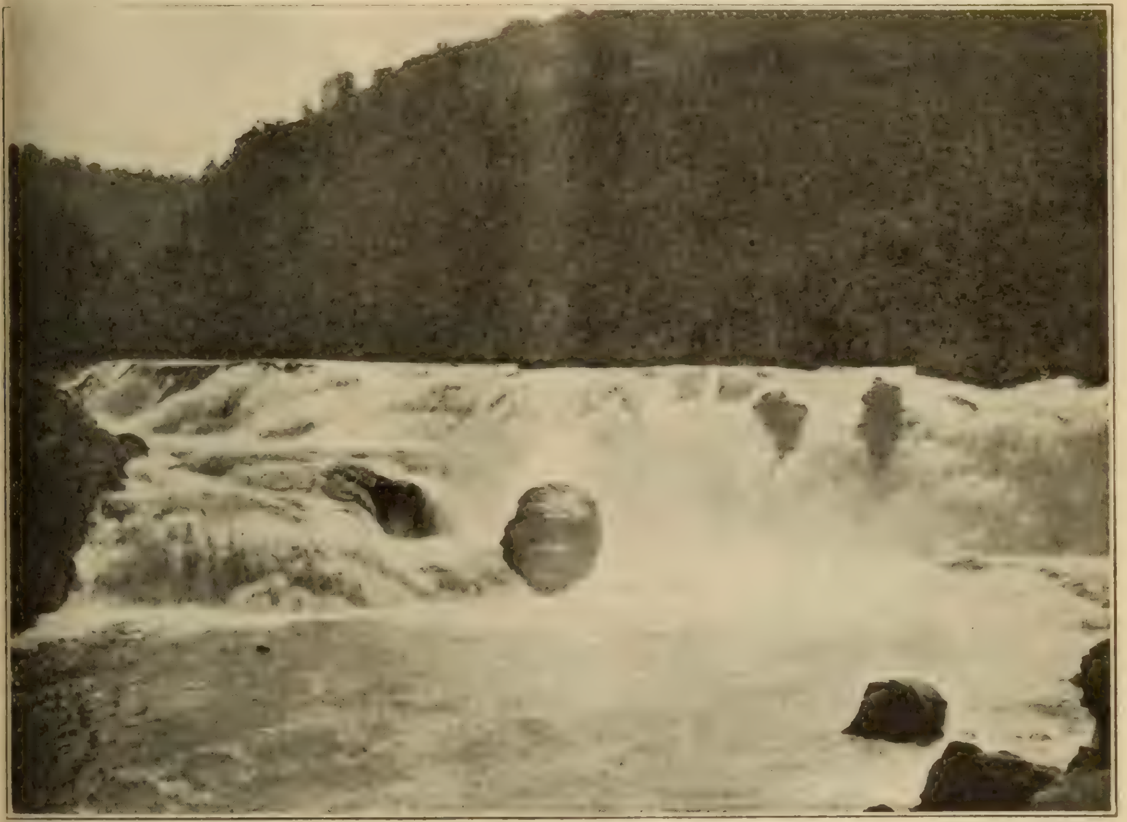
WATER POWER POSSIBILITIES ON PIT RIVER.

The statement which follows as to water power possibilities on the Pit River, power development of the Feather River, and on storage reservoir sites in the Sacramento basin, has been prepared from information furnished by Mr. M. O. Leighton, Chief Hydrographer of the Geological Survey, and by other officials of the same department.

The purpose of this statement is to give in convenient form information concerning the power possibilities of Pit River, and to designate the sections thereof that are most valuable for power development. Certain power values based on known fall and determined water supply will be given. The only thing here attempted is to give to the reader the information necessary for preliminary location of final water-power studies.

It is desired that especial emphasis be placed on the last sentence of the foregoing paragraph. Experience has shown that statements of the kind here given are grossly misunderstood, even by those who are of good repute among hydraulic engineers. For the benefit of such the Commission wishes to give assurance, viz.: *first*, that this is not intended to be a final report on the water-power privileges of the region; *second*, that the examinations necessary to the final location and adoption of a single site on any of these streams would properly consume more time and money than has been expended on the entire survey here reported; *third*, that the final development of the Pit will certainly not follow in all respects the unit divisions here suggested; *fourth*, that it would not be strange if minute study and the use of ingenuity in location would produce much more power than is estimated at some of the locations here named, and, conversely, some of the locations here described and rated may be found under present conditions of market and hydraulic practice to be quite without merit; *fifth*, that a power site which to-day may be considered unworthy a moment's consideration may in the next generation prove to be a first-class project; *sixth*, no effort has been made to study the cost of development or the market, which, in the final valuation of any site, are as important as the physical facts here considered.

Pit River is the northernmost of the larger tributaries of the Sacramento. A part of its drainage basin lies in the state of Oregon. The upper portion of the drainage area lies in country that is geologically a part of the Great Basin, the average elevation of which exceeds 6,000 feet above sea level. The average rainfall over this part of the Pit basin is about 10 inches annually. Consequently the region is semi-arid, and in some years quite arid. The flow characteristics of Pit River along this portion of its basin are typical of those of desert country streams. As far down as Bieber, California, above which the drainage area is 4,040 square miles, the flow of the river becomes practically negligible during August and September in all except very wet years. This run-off condition extends below Bieber to about the mouth of Fall River, where the Pit begins to cut through the Lassen Peak volcanic ridge which forms the southernmost portion of the Cascade Range and enters into the Sacramento Valley. Over the lower portion of the Pit basin the rainfall is 40 to 50 inches annually. The river is fed by many large springs, shows comparatively steady flow characteristics, and yields a relatively large amount of water during the minimum months of August and September. Fall River alone brings into the Pit a contribution of about 1,500 second-feet derived from springs within its basin, while Hat, Burney, Kosk and Montgomery creeks, McCloud River, and other lower tributaries, largely spring-fed, contribute materially to a steady regimen of flow.



Pit River Falls.

From the foregoing it will be seen that for water-power purposes the Pit River basin must be considered in two quite distinct parts. The first is that portion occupying the Great Basin country, the contributions of which to the lower valley consist largely of flood waters and in which the summer flow is practically negligible. The following statement taken from the flow records at Bieber show clearly the small value of the stream in its uncontrolled state in the dry period:

Year.	Minimum flow. Second-feet.	Duration of minimum flow. Days.	Average flow in second-feet during—		
			July.	August.	September.
1904	10	1	83	33	1.65
1905	0.8	2	52	9.6	1.23
1906	21	20	222	51	23.6
1907	45	8	323	72	51.5
1908	4	8	70	12	4.6

It is clear from the foregoing that the Pit basin above the mouth of Fall River is a non-productive stream from the water-power standpoint, unless provision be made for the storage of flood waters. This point will be considered farther on.

The second portion consists of the basin lying below the mouth of Fall River. For water-power purposes it is proper to treat this as a separate basin, and to neglect, except under assumptions which will later be described, the fact that the drainage from the area above passes out through the Pit. This will reduce the productive drainage area to about 1,680 square miles, at the very crest of which there is an initial flow from springs of about 1,500 second-feet.

The storage possibilities in the Great Basin portion will first be considered.

Storage—The entire flow of Pit River at Bieber can be controlled by storage reservoirs of which there are five good sites in the basin at and above this point. These sites have been surveyed by the United States Reclamation Service in connection with its studies of irrigation possibilities in the Sacramento basin.

The first and largest is the Bieber or Big Valley site. (The map of the Big Valley site has been transferred to profile sheet number 8, being one of the maps attached to this report.) A 100-foot dam located in the canyon about 7 miles below Bieber would afford a storage capacity of 3,196,000 acre-feet, an amount considerably in excess of the annual flow of Pit River. It would, however, flood some desirable land within the reservoir site which is now irrigated in its lower portion by diversion canals from Pit River and from Ash Creek. The feasibility of such a project can be determined only after thorough consideration of the cost of construction and the damages by flooding. It will be shown farther on that only about one third of the capacity of the Big Valley site will be required to control the entire flow of the Pit above Bieber. Therefore, in determining the feasibility of this reservoir, it will be important to consider the relative economy of this partial development, as compared with that of other sites in the basin. The land within the basin is said to be valued at from ten dollars to thirty dollars per acre, according to the quality of the soil and the facilities for irrigation. It is principally valuable for hay fields and stock raising.

The second reservoir site is located in Round Valley on Ash Creek, a short distance above Adin in township 39 north, range 9 east, Mt. Diablo Meridian. A dam 70 feet in height would afford a storage capacity of 184,700 acre-feet. Round Valley consists largely of meadow land in private ownership.

A third site is located in Warm Springs Valley (townships 41 and 42 north, ranges 10 and 11 east), with the dam site about 4 miles below Canby. A 70-foot dam would afford a storage capacity of 559,000 acre-feet. The entire site is in private ownership and is used for ranching purposes. The land is valued at from ten dollars to twenty dollars per acre.

A fourth site is situated in West Valley on the Lassen and Modoc county lines in township 39 north, range 14 east. A 70-foot dam located in a canyon at the mouth of the basin would afford a storage capacity of 94,600 acre-feet. The site consists of meadow land in private ownership.

The Jess Valley site, situated in township 39 north, ranges 14 and 15 east, is also in private ownership. A 60-foot dam located about 500 feet below the mouth of the basin would afford a storage capacity of 224,600 acre-feet.

Measurements of stream flow necessary to determine the most feasible storage plan are not yet available. Sufficient data have been collected at Bieber and Canby to determine the feasibility of the Big Valley and Warm Springs Valley sites, but the records that will be necessary to properly determine the relation of these sites to the other three above mentioned were started by the State Conservation Commission only about one year ago. The results are not yet of sufficient scope to make it possible to determine whether the development of these sites would reasonably compensate the low-water flow of Pit River without the development of the Big Valley or Warm Springs Valley reservoirs. Therefore, the present discussion will be wholly based on the fact that it is possible by the erection of the Big Valley reservoir to control the entire flow of Pit River above Bieber. Measurements of flow at this point are available from January 22, 1904, to September 30, 1908. This period includes a year of low water, though probably not as low as may occur in the future. Nevertheless the data can be used if a reasonable factor of safety is applied to the results. Attention is invited to the accompanying storage mass curve (Sheet Number 9) based on the recorded flow at Bieber.

A mass curve is merely a graphic representation of the discharge of a river by summation. The curve is begun by plotting the total flow for the first day, week, month, or any other suitable unit period. In the curve here discussed the month is the unit period. To the flow of the first month that of the second is added, and to the sum of these two the flow of the third, and so on throughout the entire record.

The Pit River curve shows that the total flow throughout the period above mentioned is approximately 3,570,000 acre-feet. The mass curve shows not only the total volume of water at any designated time, but also the relative rate at which the water was delivered from month to month, indicating clearly the periods of large and small flow. Accompanying this curve is a vector diagram showing the slope of the lines corresponding to a discharge of from 1,000 to 2,000 second-feet. The vector diagram may be simply explained by saying that if the mass curve of any river were a straight line taking the direction of, say the 1,000 second-foot vector, then that river would have a uniform flow of 1,000 second-feet all the year round. The fact that the mass curve of Pit River is crooked shows that its flow is not uniform, being at times more, and at other times less than 1,000 second-feet.

Pit River, above falls.

To determine the amount of storage necessary to produce a given uniform flow, the mass curve serves better than any other form of expression yet devised. In the case of the Pit River curve the straight line extending between the crests of the two largest "humps" is approximately parallel to the vector that represents a flow of 1,000 cubic feet per second. The testimony given is as follows: Starting at the crest of the first "hump," which corresponds to the month of May, 1904, the line again joins the curve at a point corresponding to the month of June, 1907. During the intervening period the flow of the river varied enormously, being at times in excess of 20,000 second-feet and at others less than 10 second-feet. What is the storage capacity that would have been necessary to maintain the flow in the river below the dam, at a rate represented by the vector that connects the crests of the two large humps on the mass curve? It is represented by the equivalent of the maximum ordinate running from the vector line to the curve, the position of which corresponds to that of December, 1905. By the ordinate scale the amount represented is about 825,000 acre-feet. This is the storage capacity that would, during the period of observation at Bieber, have enabled those in charge of the reservoir to maintain the flow below the dam at not less than a trifle in excess of 1,000 second-feet. As the available storage capacity at the Big Valley site is more than 3,000,000 acre-feet, it is apparent that only a small part thereof would require development in order to completely control the flow of Pit River below Bieber.

It will now be necessary to consider the net yield that may be produced by such a reservoir. It has already been stated that the period of observation used for constructing the mass curve does not embrace a year of extreme low water. This warrants a reduction in practical estimates of the amount indicated above as continuously available under storage. On the other hand, it should be recognized that the actual difference between the low waters in the years of record and that in an abnormally low year does not amount to much in the aggregate when compared with the large volumes that would actually be available for storage. Indeed, it might occur that it would not introduce any change in vector direction on the mass curve.

A compensating factor arises from the fact that there is considerable irrigation taking place during the low-water seasons within the basin of the proposed Big Valley reservoir. How much water is diverted from the stream is not known, but from the area of land irrigated it is easily determinable that it must be a considerable amount. A large part of this water is lost by absorption and evaporation. If the reservoir were constructed, the land would be overflowed and the irrigation would cease. Against this, however, is the evaporation loss that would take place from the reservoir surface. It is not known how much this would be, but it would probably be in excess of three vertical feet annually, an amount which markedly reduces the effective capacity of the reservoir. In view of recognized losses and the uncertainties concerning the amounts thereof, it will in subsequent estimates be conservatively assumed that the amount available from the reservoir throughout the year would be only 900 second-feet instead of 1,000 as indicated by the mass curve.

The amount of water available from that portion of the Pit basin below the proposed Big Valley reservoir will now be considered. No long-term records of flow are available, and it is necessary to make estimates based largely on certain short-term data and the excellent records on Sacramento River at Iron Canyon.

The marked difference between the run-off characteristics of the upper and lower portions of the Pit basin, previously described, make it unsafe to extend without confirmatory studies the daily run-off ratios based on Iron Canyon records up to the various power sites on the Pit between its mouth and Fall River. The only data available on the Pit are one year's records at a point near Ydalpom about 3½ miles above the mouth of McCloud River and a few observations at Henderson. There are fairly adequate data on the McCloud, and these are of material assistance in determining the yield of the Pit. The natural conditions in the basin render it possible to make a very close estimate of the minimum flow. Practically all of the precipitation over the Pit basin occurs from November to April of each year. Therefore, during the months of July, August and September the records of Iron Canyon show a gradually diminishing flow. The discharge during such periods consists entirely of the water yielded from ground storage. There are few or no complications due to increase in flow on any of the tributaries occasioned by small rains, and the whole basin is in what might be called a state of drainage equilibrium. The relations between the

A view of the Pit River.

flow at Iron Canyon and at any other point above that place on the basin are quite uniform. This is borne out by a comparison of the records at Iron Canyon on the Sacramento, and at Gregory on the McCloud. It is possible to construct a reasonably accurate rating curve based on these two series of records. It naturally follows that a rating table may be constructed for the Pit near Ydalpom on the same basis using records secured at the two places during July, August and September, 1911. Examination of the records at these two places reported in Water Supply Paper 298 of the Geological Survey, prepared in coöperation with the State Conservation Commission and the State Water Commission, will show how steady is the flow of both rivers during those two months and how gradual is the decrease in flow. Pursuing the matter in this way, the following rating table has been derived:

Relative flow of Pit River near Ydalpom and Sacramento River at Iron Canyon, July, August, and September, 1911.

Sacramento River (second-feet).	Pit River (second-feet).
4,000	2,500
4,250	2,640
4,500	2,790
4,750	2,940
5,000	3,100
5,250	3,290
5,500	3,520
5,750	3,770
6,000	4,160

The lowest flow recorded on Sacramento River at Red Bluff occurred from September 7 to 28, 1903, and amounted to 3,980 cubic feet per second. The equivalent at Ydalpom according to the above rating is about 2,490 second-feet.

The only other record of assistance in properly extending the minimum flow relation up river from Ydalpom consists of two measurements made at the gaging station at Henderson on May 9 and August 12, 1911. The relations between the discharge at Ydalpom and Henderson on those two days are as follows:

	Ydalpom (second-feet).	Henderson (second-feet).
May 9	6,740	5,350
August 12	3,220	3,110

The flow relations of Henderson to Ydalpom on the two days are .8 and .9, respectively. Inasmuch as the relation of August 12th represents a condition of drainage equilibrium on the basin, coming as it does in the midst of a long dry period when the flow of the river was gradually subsiding, it is undoubtedly preferable for use in determining the minimum flow relation. Under this assumption the indicated minimum flow at Henderson would be 2,240 second-feet.

The effective drainage area above Ydalpom is 1,661 square miles. That above Henderson, or the mouth of Kosk Creek is 762 square miles. The intervening drainage area, 899 square miles was therefore productive of only 250 second-feet, or .28 second-feet per square mile. It is evident that the area above Henderson is far more productive than that below.

The distribution of flow above Henderson is very difficult of determination from the scanty information available. It is known that the Fall River springs furnish the greater part of this flow and that the yield of Fall River is approximately 1,500 second-feet. The only actual measurement of record was one made on September 9, 1901, near the mouth of the stream, the flow being 1,450 second-feet. This date is fortunately near the close of the dry season when the flow was at or near its minimum. A measurement made on September 2d of the same year at the old gaging station on Sacramento River at Jelly's Ferry, a short distance above the present Iron Canyon station, gives a discharge of 4,390 second-feet, which is close to the minimum observed at the latter point. It is safe to assume then that the year 1901 was one of low water in that region, and the gaging above noted on Fall River reasonably indicates the minimum at that point.

By subtracting from the indicated minimum flow at Henderson 2,240 second-feet, the probable minimum of Fall River 1,450 second-feet, there will remain 790 second-feet which may safely be considered as derived from the 762 square miles lying above Henderson. This is equivalent to about 1 second-foot per square mile.

On the above basis of estimate the water powers on the Pit will be rated as follows: Start at the head of the effective area with 1,450 second-feet, the contribution made by Fall River; from there to Henderson increase the flow by a factor of one second-foot per square mile; from Henderson to Ydalpom increase by a factor of .28 second-foot per square mile. This schedule, while unsatisfactory in some respects, probably does not do violence to reasonable probability and cannot fail to be much safer than the usual estimates based on rainfall records and remote and incomplete flow measurements.

POWER SITES.

The following power estimates are based on the theoretical power of a given amount of water, falling over a given height, the result reduced to 70 per cent to allow for mechanical and hydraulic losses in conduits, water motors and tailrace. This will give a result that will conservatively represent available power on the wheel shaft.

Big Valley dam site to the mouth of Fall River—This stretch of river is about 31 miles long. It has already been explained that because of very low flow during August, September, and in some years, through October and November, the river as far down as the mouth of Fall River is without value for primary power unless storage reservoirs are constructed. It has further been indicated that with the Big Valley reservoir constructed, a minimum flow of 900 second-feet may be assured. While it is probable that the drainage area between the reservoir site and the mouth of Fall River yields some water during dry seasons, the amount is very small and for primary power studies may safely be neglected. This stretch of the Pit will therefore be rated on the basis of 900 second-feet available from the Big Valley reservoir.

The stretch of river here discussed is naturally divided into four portions, two of which are of great slope and the remaining two of which are practically flat. The first section begins about one half mile below the dam site, corresponding approximately to Mile 118 on the accompanying profile. From there to about Mile 108, the fall is about 760 feet, or 76 feet per mile (as found on Sheets 7 and 8 of profile). The available power along this section, based on the factors and assumptions above given, is 54,720 horsepower.

The second section extends from Mile 108 to about Mile 100.5. (Sheet No. 7 of profile.) Along this stretch the stream meanders through a wide valley and the total fall is 33 feet or 4.4 feet per mile. This section will not be considered for power purposes except as described in the next paragraph.

The third section extends from Mile 100.5 to about Mile 99.5. (See Sheet 7.) The fall over this single mile of river channel is 62 feet and the available power is 4,460. It should be noted that it would be possible to increase the head at this site by the erection of a dam just above the head of this section where the broad valley noted in the previous paragraph narrows somewhat. A dam 40 feet high would be about 2,900 feet long and would overflow the entire valley above and reduce by about 7 feet the available fall in the first section above described. The increase of power afforded at the third section would be above 2,880 horsepower. Such a development is not seriously proposed because of many obvious reasons and difficulties. The possibility is merely noted because in some future time changed conditions of power market may render it worthy of consideration.

The fourth section from Mile 99.5 to the mouth of Fall River is practically flat and has no power importance. (See Sheets 7 and 6.)

The available power from Big Valley dam site to the mouth of Fall River is, under the assumption above made, 59,200 horsepower.

From the mouth of Fall River (about Mile 90) to Mile 80. (Sheet No. 6 accompanying this report.) Along this section there is a fall of 488 feet. The effective flow for primary power purposes, is assumed, as explained in a previous paragraph, to be the low-water flow of Fall River. *i. e.*, 1,450 second-feet. The available primary power is therefore 56,600 horsepower. With an additional flow of 900 second-feet available from Big Valley storage the primary power would be 91,700 horsepower.

In the actual development of power along this section, the total head might be increased considerably by the construction of a dam at or near the upper limit. Between Mile 91 and Mile 89.2 there are a large number of possible dam sites. A dam raised to say 3,300 feet above sea level would be less than 75 feet high and would afford an additional head of 55 feet. The broad flat valley above would be submerged, and also the power privilege at Mile 100. Whether it would be of hydraulic advantage to combine the two sites in this way, and whether the cost of the same and the damages from flowage would outweigh such advantages, is a matter for minute local study. A shortening of the headwater conduit by tunnel across the bend which has its heel at Mile 88 would probably be feasible and economical whether the diversion were made at grade or at dam elevation.

Section from Mile 80 to the mouth of Burney Creek (Mile 70.7). (Sheet No. 5 of profile.) This section has a relatively low slope, the total fall being 69 feet or about 7.5 feet per mile. Therefore, it does not offer as good power privileges as some other parts of the river. If the demand for power were sufficiently great, it might be practicable to utilize the entire fall along this section by erecting a dam in the head of the canyon at about Mile 70, flooding the valley above and thereby increasing the available head in the section next below.

Section from Burney Creek (Mile 70.7) to Rock Creek (Mile 66). (Sheet No. 5 of profile.) The fall along this section is 134 feet or about 28.5 feet per mile. By reason of the tortuous channel of the river a tunnel conduit would shorten the distance from diversion to power house to about 2¼ miles. As the channel lies in a steep canyon along the entire stretch it is probable that a tunnel would be as cheaply constructed as an open or pipe conduit following the river's course.

The effective drainage area above the mouth of Burney Creek, including that of said creek, is 649 square miles. On the assumption previously made, *i. e.*, a minimum flow of 1 second-foot per square mile, and a minimum flow of 1,450 second-feet from Fall River, the available flow for primary power development in this section is 2,099. This amount developed over a head of 134 feet would produce 22,500 horsepower. With Big Valley storage available the primary power would be 32,100 horsepower.

Section from Rock Creek (Mile 66) to Mile 62.5. (Sheets Nos. 5 and 4 of profile maps.) Along this 3½ mile stretch the fall is 143 feet. The drainage area above and including Rock Creek is 700 square miles. This indicates a probable minimum flow of 2,150 second-feet, equivalent to 24,600 horsepower. With Big Valley storage available, this would be increased to 34,900 horsepower.

Section from Mile 62.5 to Mile 54.6. (Sheet No. 4 of profile map.) This section lies entirely in canyon like the one above and has a fall of 340 feet. The effective drainage area above the head of the section is 720.4 square miles. The minimum flow without storage is 2,170 second-feet and with Big Valley storage would be 3,070 second-feet. The horsepower equivalents are 59,000 and 83,500, respectively.

Section from Mile 54.6 to mouth of Kosk Creek (Mile 47.2). (Sheets Nos. 4 and 3 of profile maps.) The effective drainage area above the head of the section is 734.5 square miles, and the total fall is 470 feet. The minimum flow is therefore 2,184 second-feet, equivalent to 82,100 horsepower. With Big Valley storage the power would be 116,000 horsepower.

Section from Kosk Creek (Mile 47.2) to Mile 40. (Sheet No. 3 of profile map.) Near the head of this section is the Henderson gaging station, below which, as noted on a previous page, the run-off per square mile factor is changed to .28. This section is 7.2 miles long and has a fall of 245 feet. The drainage area above Kosk Creek is 786 square miles. This creek drains 63.7 square miles. The minimum flow at the head of the section is therefore about 2,254 second-feet, which, over a 245-foot fall, is equivalent to 44,200 horsepower. Big Valley storage would increase this to 61,800 horsepower.

Section from Mile 40 to mouth of Montgomery Creek (Mile 31.7). (Profile sheets Nos. 3 and 2.) The fall in this section is 230 feet or about 28 feet per mile. The drainage area above the head of the section is 891.7 square miles which will yield a minimum flow of 2,270 second-feet. The equivalent horsepower is 41,800 and with Big Valley storage, 58,300.

Section between Montgomery Creek (Mile 31.7) and Mile 27.4. (Profile sheet No. 2.) This section includes the 891.7 square miles above the previous section, the 90.1 square miles between Mile 40 and the mouth of Montgomery Creek and the 47.4 square miles constituting the basin of said creek—in all 1,029.2 square miles. This is an increase of 137.5 square miles, the minimum flow of which is 38.5 second-feet. This amount added to the 2,270 second-feet available in the section next above gives a total of about 2,300 second-feet. The fall in the section is 101 feet or 23.5 feet per mile. The available primary power is therefore 18,600 horsepower, which would be increased by Big Valley storage to 25,900 horsepower.

Section between Mile 27.4 and Mile 20.5. (Profile sheet No. 2.) The effective drainage area above the head of this section is 1,049.9

square miles, and the minimum flow is 2,310 cubic feet per second. The total fall in this section is 120 feet, and the indicated primary power is 22,200 horsepower, which would be increased by Big Valley storage to 30,800 horsepower.

Section between Mile 20.5 and Mile 9. (Profile sheets Nos. 2 and 1.) The drainage area above the head of this section is 30.8 square miles greater than that of the next previous section. Therefore the minimum flow is increased by about 9 cubic feet per second or a total of 2,320. The fall in the section is 165 feet or 14.3 feet per mile. This will afford a primary power of 30,600, or with Big Valley storage, 42,500 horsepower.

Section from Mile 9 to mouth of McCloud River (Mile 4.6). (Profile sheet No. 1.) The drainage area above this section is 145 square miles greater than that above the previous section. Therefore, the minimum flow is increased by about 41 second-feet or a total of 2,341 second-feet. The fall in this section is 55 feet, or 12.5 feet per mile. This will afford a primary power of 10,300, or with Big Valley storage 14,300 horsepower.

In the 4.6 miles between McCloud River and the mouth of the Pit the fall of the river is 40 feet or less than 10 feet per mile. While the total available power is relatively large, this section of the stream does not appear to be well adapted to power development and will therefore not be considered in this report.

A summary of the foregoing paragraphs appears in the following table. This table does not include all the power facilities of the Pit basin. Some of the tributaries, notably the McCloud and Fall rivers, are extremely efficient power streams which at some time in the future should be surveyed and presented in the manner followed in this report.

There are also several reservoir sites not described in this report, the development of which would add materially to the primary power available in the main stream.

Table showing possible power development on the Pit.

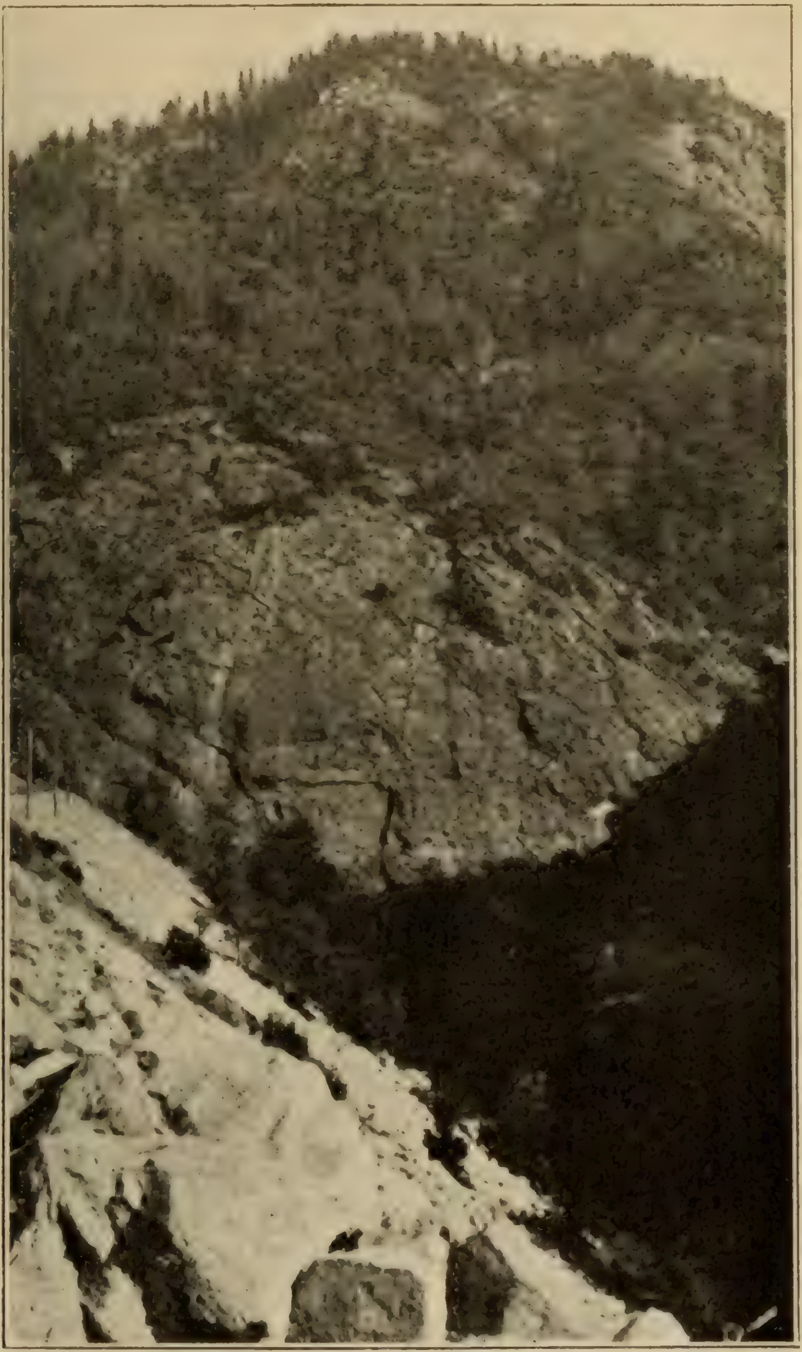
FEATHER RIVER.

The plans and profiles made in this basin for the present report are confined to the Middle Fork of Feather River. A final report on the water-power possibilities must be postponed until sufficient records of stream flow can be accumulated. We have arranged to install automatic gages at favorable points along the streams. At present, the only available data are those secured at three stations. The first is on the Middle Fork near Cromberg, in the north ½, section 24, township 23 north, range 11 east. It has been maintained since November 3, 1910, as the result of coöperation between the Geological Service and the U. S. Forest Service. The gage is read occasionally when a Forest Service official finds it possible to make a visit. Only two current-meter measurements have been made, one November 3, 1910, when the discharge was 54 second-feet, and another on October 28th, discharge, 89 second-feet. The data are not sufficient for any reasonable safe approximations of flow. The second station in the Middle Fork basin was located on Grizzly Creek near Beckwith, Cal. It was established December 17, 1905, and discontinued on September 30, 1906, because it was impossible to secure an observer. During this short period a maximum flow of 681 second-feet and a minimum flow of .2 second-feet were observed. These records are not sufficient for the determination of Grizzly Creek discharge, and are quite inadequate to show the discharge of the Middle Fork in the higher portions of the basin. The third station is located at Bidwell Bar near the mouth of Middle Fork, and has been maintained since October 7, 1911. Here, too, the period of observation is too short to permit of reliable estimates.

The Middle Fork, Feather River.

Although fairly satisfactory data have been secured on the North Fork, the figures cannot be applied to the Middle Fork because of the fact that the two basins differ geologically. By reason of the fact that the basin of the North Fork is so largely overlaid with lava, which results in a comparatively steady run-off, and the occurrence of large springs, the run-off characteristics must be markedly different from those of the Middle Fork of Feather River, which is largely a granitic area. It is known in a general way that the yield of the Middle Fork is considerably less than that of the North Fork. Neither is it possible to apply the run-off data of Yuba River which lies south of the basin of the Middle Fork. The only record in the Yuba basin extending over



A view of Grizzly Creek near headwaters of Middle Fork, Feather River.

a period of years sufficient to permit of reliable estimates is that at Smartsville in the foothills. The stations in the upper portions of the Yuba have not been maintained for a period sufficiently long to permit of any estimates. With the Yuba basin data as a guide, an approximate estimate of the flow of Middle Fork might be derived, but the degree of accuracy would be problematical and the variation of the estimates from the truth might be as much as 500 per cent. Therefore, it is believed wise to defer any water-power estimates for this stream until flow records have been secured.

A view of the Feather River just below Oroville.

In lieu of the report on the power possibilities of the Middle Fork the following statements are submitted concerning the developed and undeveloped power on the North Fork of Feather River. The statements are taken from a report written by E. C. Murphy, hydraulic engineer, U. S. Geological Survey.

The basin of Feather River above Oroville, Cal., is 3,640 square miles in extent. The country is mountainous throughout, with deep narrow canyons interspersed here and there by meadows. It is heavily covered with commercial timber in the higher parts and with a thin growth of scrubby timber in the lower portion.

The main stream is formed 27 miles above Oroville where the Middle and North forks join. The former has a drainage area of 1,340, and the latter, 2,220 square miles. The unit run-off of the former is considerably less than that of the latter.

North Fork basin is naturally divided into several smaller ones, two of these known as the Eastern and Western basins, lying above Prattville. The Eastern basin has an area of 230 square miles and is drained by the Hamilton Branch, while the Western, having a drainage area of 245 square miles, is drained by the North Fork. These two streams join about 3 miles below Prattville at the lower end of Big Meadows.

North Fork of Feather River above Yellow Creek and Belden Station on the Western Pacific Railway.

About 7 miles below Prattville, Butt Creek joins the North Fork from the west. This stream drains an area of 74 square miles. Eight miles below Butt Creek, the East Branch, the basin of which is 1,020 square miles in extent, joins from the east. Two miles farther down, Yellow Creek enters the North Fork, while West Branch joins near Las Plumas about 9 miles above the mouth of Middle Fork.

In the southern part of the Feather River basin, the formation is mainly of granite with a good covering of soil; in the northern part the formation is mainly porous lava with a covering of soil which rapidly absorbs water. The result is that ground storage in the North Fork basin is abundant and several of the tributary streams are formed by large springs, one of which has a minimum flow of 70 second-feet.

Flow records of Feather River have been maintained at Oroville during the period 1902 to 1911. The records of daily stage and discharge appear in Water-Supply Paper 298. The year 1908 is the lowest of record in the series, and the discharge for this year will be given farther on.

A station was located by the Great Western Power Company near the head of Big Bend tunnel, about 20 miles above Oroville, and the records are available for five and one half years. The mean monthly and annual results are given in the following table:

Monthly discharge of North Fork Feather River at Big Bend, California.
(In hundred second-feet.)

Drainage area------------------------------------1,940 square miles.

Month.	1906.	1907.	1908.	1909.	1910.	1911.	Mean.	Per cent annual.
January	64.9	35.1	37.7	--------	29.9	28.6	39.6	7.3
February	51.5	129.0	29.9	--------	35.6	37.1	56.6	10.6
March	96.8	183.0	45.9	--------	90.0	59.1	94.6	17.6
April	99.1	138.0	56.6	--------	70.0	154.9	105.7	19.7
May	94.3	93.3	51.3	--------	40.0	127.2	81.2	15.1
June	75.7	62.5	37.0	--------	15.8	86.9	55.6	10.4
July	29.2	27.0	15.9	18.2	11.6	21.8	20.6	3.9
August	15.4	17.2	10.1	12.9	9.7	17.4	13.8	2.5
September	13.1	14.7	9.9	12.0	10.0	12.9	12.1	2.3
October	12.4	15.2	11.9	14.8	10.1	11.9	12.7	2.4
November	16.1	15.8	13.1	32.3	12.8	12.6	17.1	3.2
December	40.7	29.8	13.0	36.2	22.4	10.6	27.1	5.0
Mean	50.8	63.4	27.7	--------	29.8	48.4	44.8	--------

Although the mean annual flow was lower in 1908 than in any other year, the discharge being 2,770 second-feet, the lowest mean monthly flow was in August, 1910, when the mean discharge dropped to 970 second-feet. On the 15th of this month, the flow was less than 800 second-feet.

A third station, also maintained by the Great Western Power Company, is located at the dam site of the Big Meadows reservoir below the mouth of Hamilton Branch. The average monthly flow at this station for the five and one half years of record is given in the following table:

Monthly discharge North Fork Feather River below Prattville, California.

Drainage area------------------------------------506 square miles.

Month.	1905.	1906.	1907.	1908.	1909.	1910.	Mean.	Per cent annual.
January	--------	937	814	917	2,550	844	1,212	8.0

December	607	894	939	612	1,010	908	828	5.5
Mean	--------	1,320	1,720	903	1,450	987	1,264	--------

The minimum monthly flow of the North Fork at the station above mentioned occurred in August, 1910, when the average discharge was 602 second-feet, equivalent to a total monthly run-off of 37,000 acre-feet. The mean rate of flow for the entire period was 1,264 second-feet, equivalent to an annual run-off of 915,100 acre-feet. The year of least flow is 1908 when the total run-off was 653,800 acre-feet.

A fourth station also maintained by the Great Western Power Company is located on Butt Creek in Butte Valley about 2 miles above the mouth. The monthly record for the five and one half years of observation period is given in the following table:

Monthly discharge of Butt Creek, Butte Valley, California.

Drainage area------------------------------------73 square miles.

Month.	1905.	1906.	1907.	1908.	1909.	1910.	Mean.	Per cent annual.
January	--------	221	95	77	460	66	184	12.5
February	--------	141	312	63	178	73	153	10.5

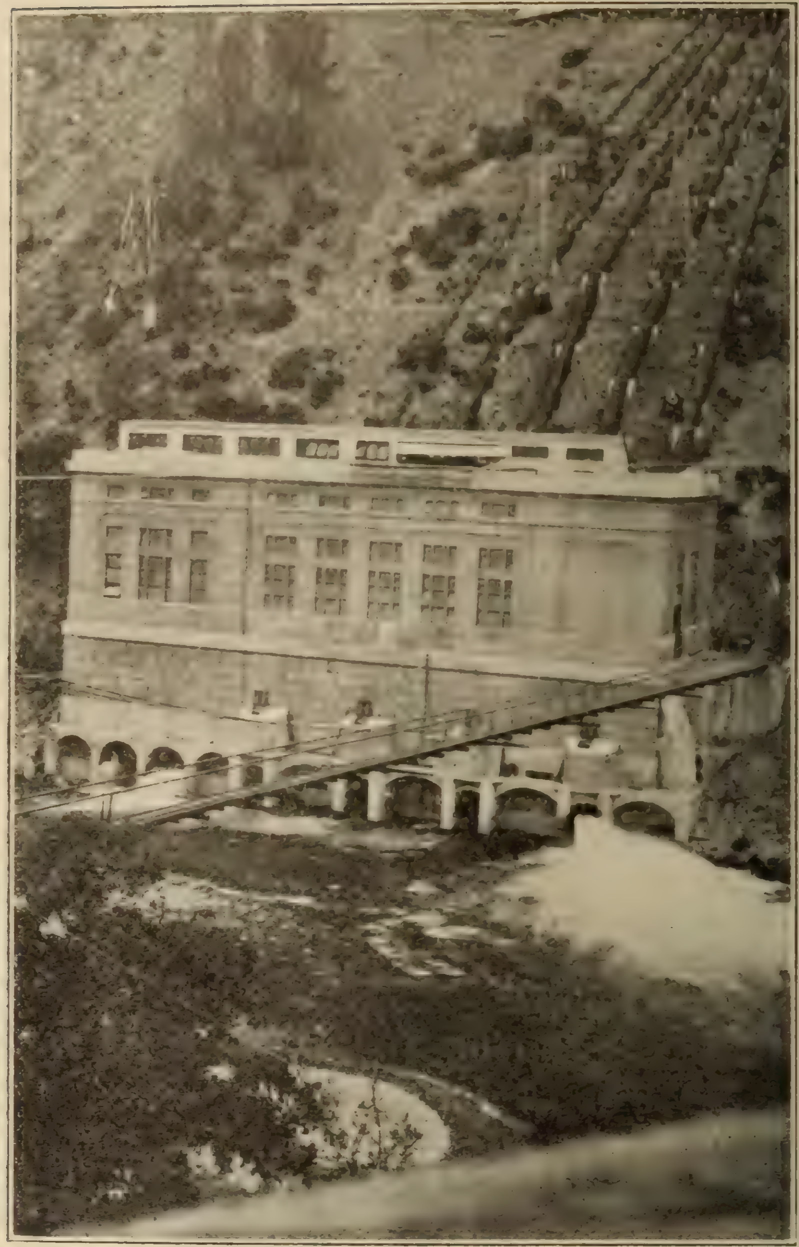
November	33	49	42	28	84	35	45	3.1
December	59	90	98	30	91	53	70	4.8
Mean	--------	158	178	66	145	68	122	--------

The average run-off per square mile of Butt Creek is about 24 per cent less than that of North Fork, and the minimum is 50 per cent less. The mean annual flow is 122 second-feet, equivalent to 88,300 acre-feet. In the lowest year of record, 1908, the total discharge was 47,800 acre-feet.

The flow of Yellow Creek has not been measured. It has been assumed that its annual run-off per square mile is about the same as that from



The Great Western Power Company's Plant, at Big Bend, on the Feather River.

Butt Creek, or 1.76 second-feet. As the basin has an area of about 80 square miles, the mean rate of flow would be, on this assumption, 133.6 second-feet, equivalent to 96,700 acre-feet.

Indian Creek has been measured for four years at a point near Crescent Mills, about 5 miles above the mouth of Spanish Creek. The results appear in the following table:

Monthly discharge Indian Creek (East Branch) near Crescent Mills, California.

Drainage area------------------------------------740 square miles.[1]

Month.	1906.	1907.	1908.	1909.	Mean.	Per cent annual.
January	870	500	480	2,910	1,190	11.0
February	820	2,210	360	1,380	1,192	11.0

December	534	384	124	484	381	3.5
Mean	850	1,140	350	1,020	902	

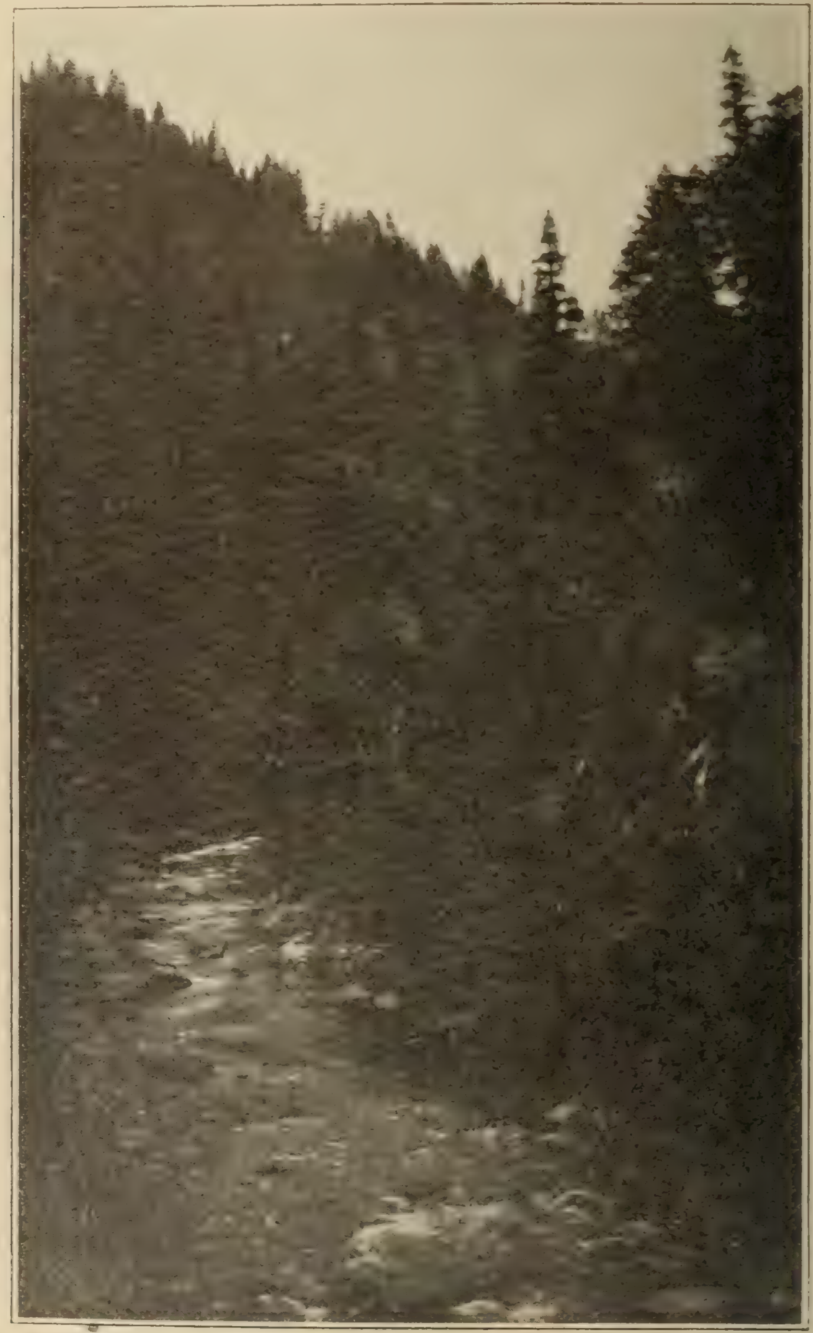
---

[1] Total area drained by this stream, 1,025 square miles.

The run-off per square mile of Indian Creek is only about one half as large as that of North Fork at Prattville. Its maximum monthly rate is, however, nearly twice as large while the minimum is less than one tenth of that of North Fork. The record shows that the minimum monthly flow was 15 second-feet which occurred in August, 1908, which is equivalent to a total run-off for this month of 938 acre-feet. The mean annual run-off was 653,000 acre-feet and the minimum 253,400.

No flow measurements are available on Spanish Creek. The drainage area is about 175 square miles and has a lower elevation than that of Indian Creek, and therefore its run-off is somewhat less. If the mean rate be assumed to be 80 per cent of that of Indian Creek, the mean annual flow must be about 171 second-feet, equivalent to 123,800 acre-feet. A gaging made on August 14, 1912, showed the flow of this stream to be 28 second-feet. In the following discussion the minimum monthly flow of East Branch from the mouth of Spanish Creek to the North Fork has been taken as the sum of the rates of the flow of Indian Creek at Crescent Mills and Spanish Creek at Keddie, and is equivalent to 35 second-feet.

Flow records in Feather River basin cover relatively short periods of time. It is, therefore, probable that the minimum flow may have occurred before measurements began. If this is true the correct mean flow in the basin is less than that indicated by the existing records. It will therefore be of advantage to examine the measurements of precipitation in the basin, which cover a much longer period than those of stream flow. Such an examination may make it possible to estimate in a relative way what was the probable minimum flow during the period not covered by the flow records. Four places have been selected in the Feather River basin where precipitation has been observed, namely, Oroville, Quincy, Greenville, and La Porte.



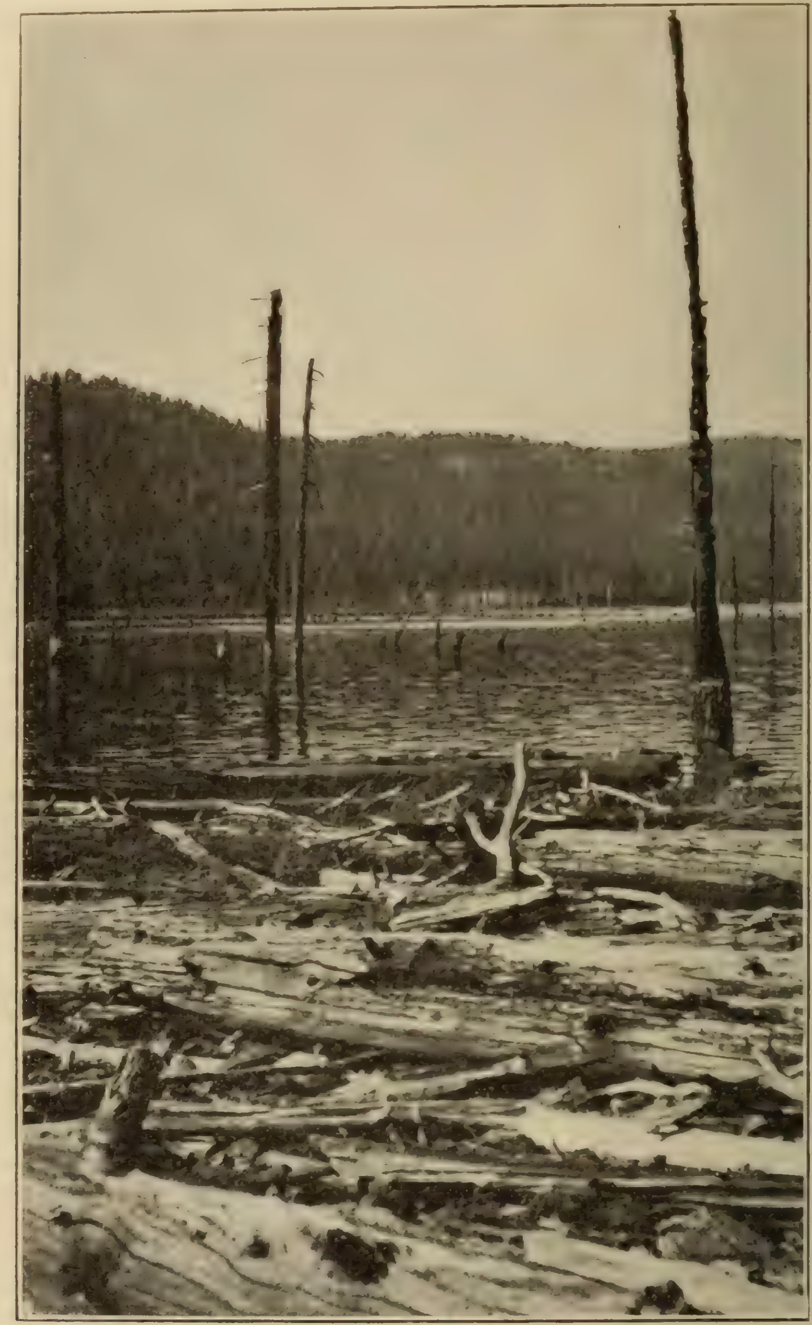
Mouth of Yellow Creek, showing flow to be developed by Oro Light and Power Company.

The following table gives the elevation, length of record, annual and average precipitation for the period of record, the mean for the period 1906–1911, the mean for 1906–1909, and the record for 1898 at these four places. The data are obtained from the records of the United States Weather Bureau.

Precipitation in Feather River Basin.

	Elevation.	Length of record.	Precipitation normal.	Precipitation.						Mean precipitation.		
				1906.	1907.	1908	1909.	1910.	1911.	1906-1911.	1906-1909.	1898.
Oroville	250	25	28.41	42.37	31.33	18.83	41.48	12.22	29.14	29.23	33.50	13.78
Quincy	3,400	14	48.41	66.92	67.10	32.37	68.87	23.65	46.95	50.99	58.84	24.28
Greenville	3,600	15	44.04	66.45	60.73	25.77	63.50	28.59	54.53	49.93	54.11	21.08
La Porte	5,000	13	89.17	124.46	113.94	58.08	141.40	60.22	----------	99.62	109.47	40.37

The foregoing record shows that in the year 1898 the precipitation at each of the points of observation was from 18 to 30 per cent less than in the year 1908, which, as will be remembered, was the minimum year of flow during the period of flow observations. The year 1897 was also dry, being from 14 to 33 per cent less than the normal. The mean precipitation for the period 1906 to 1911 is from 3 to 12 per cent greater than the normal. It is, therefore, apparent that the mean annual run-off indicated by the 1908 flow observations at Big Bend is greater than the actual mean run-off. The difference is probably about 15 per cent. The mean precipitation for the period 1906-1909 is from



The Round Valley Reservoir, near Greenville, Plumas County.

18 to 23 per cent greater than normal. The mean annual run-off obtained at the gaging station on Indian Creek near Crescent Mills is therefore greater than the normal by at least 20 per cent.

During the period of stream measurement the precipitation has been below the normal only two years in succession at any of the points of observation. Prior to the stream measurement period the precipitation at all of the four points mentioned was below the normal for four consecutive years and at Greenville it was below the normal for seven consecutive years. It therefore appears that the minimum shown by the flow records is neither as long nor as intense as would have been indicated in previous years.

Storage possibilities—There are four large reservoir sites in North Fork basin, namely, Big Meadows, Indian Valley, Butt Creek, and Yellow Creek. The dam of the Big Meadows site is about 1 mile below the junction of Hamilton Branch and North Fork. It is being built at the present time and will be completed in 1913. This reservoir will have a capacity of 1,080,000 acre-feet. The average annual run-off for the five and one half years has been shown to be 915,100 acre-feet.

The dam site of Indian Valley is in the canyon below Crescent Mills. This reservoir has a capacity of 688,000 acre-feet. The average annual run-off near this site for the four years 1906 to 1909 was 653,000 acre-feet.

The dam site of the Butt Creek reservoir is about 2 miles above the mouth of Butt Creek. This reservoir will have a capacity of 106,000 acre-feet. It has been shown that the mean annual run-off at this site for five and one half years is 88,300 acre-feet. This site and the Big Meadows reservoir site are owned by the Great Western Power Company.

The dam site of the proposed Yellow Creek reservoir is about 8 miles above the mouth at the lower end of Humbug Valley. A dam 100 feet in height at this place will give a storage capacity of 96,400 acre-feet. This reservoir will be built by the Oro Electric Corporation.

Estimated flow with storage reservoirs installed—A study will now be made of the effect of storage in the above-named reservoirs on the flow of streams during the year 1908. The previous year, 1907, was one of large flow. At the four precipitation stations previously mentioned, the rate of precipitation was from 11 to 30 per cent greater than the normal. It will therefore be assumed that the volume of water in each of the reservoirs at the beginning of 1908 was 50 per cent of the mean annual flow of the year 1907. For convenience the monthly flow for the year 1908 at each of the five gaging stations is given in the following table:

Monthly discharge of streams in Feather River basin, 1908.

Month.	3640 sq. mi. Feather at Oroville.	1940 sq. mi. North Fork Feather at Big Bend.	506 sq. mi. North Fork Feather at Prattville.	73 sq. mi. Butt Creek at Butte Valley.	Indian Creek at Crescent Mills.

October	1,650	1,190	794	27	59
November	1,750	1,310	758	28	94
December	1,910	1,300	939	30	124
Year.					
Second-feet	4,400	2,700	1,720	66	351
Acre-feet	3,215,000	2,005,000	1,245,000	47,800	254,100
Drainage	3,640	1,940	506	73	740

On the foregoing assumptions the stored water in the reservoirs at the beginning of 1908 would have been as follows:

Big Meadows reservoir, 457,600 acre-feet, equivalent to a continuous flow of 632 second-feet.

Butt Creek, 44,900 acre-feet, equivalent to a continuous flow of 62 second-feet.

Yellow Creek reservoir, 95,200 acre-feet, equivalent to continuous flow of 66.8 second-feet.

Indian Creek reservoir, 326,500 acre-feet, equivalent to a continuous flow of 451 second-feet.

It has been estimated that all the water in storage at the beginning of 1908, less losses assumed to be 10 per cent, could have been used during that year without a shortage during the next year. It happens that the year 1909 was one of more copious precipitation than that of 1907. With all this storage available at the beginning of 1908 plus the natural flow during the year, the minimum monthly flow below each reservoir would have been as follows:

Big Meadows reservoir, 1,472 second-feet instead of 610 second-feet.
Butt Creek reservoir, 122 second-feet, instead of 25 second-feet.
Indian Creek reservoir, 756 second-feet, instead of 15 second-feet.

The minimum monthly flow of East Branch with storage may be taken to be 775 second-feet, without storage it is about 30 second-feet. The minimum monthly flow of North Fork from East Branch to Yellow Creek may be taken to be 2,370 second-feet with storage and 665 without storage. Below the mouth of Yellow Creek the minimum flow with storage would be about 2,500 second-feet, without storage 700 second-feet.

At Big Bend the minimum flow with storage would have been about 2,800 second-feet; without storage it was 990 second-feet.

It should be remembered that these figures, though applicable to the year of lowest stream flow of record, are based on the assumption that 50 per cent of the mean annual flow at the reservoirs was in storage at the beginning of 1908, and also that dry periods of longer duration and greater intensity than that of record have occurred.

Stream slope—The elevation of places along North Fork given in the following table were obtained from the topographic sheets and are only approximations. The distance between places are scaled from maps. The power houses and dams mentioned in this table belong to the Great Western Power Company and are described later. Project No. 1 is completed, and preliminary work has been commenced on Nos. 2 and 3. The location of power houses Nos. 2 and 3 and dams Nos. 2 and 3, and also the height of these dams, are subject to change:

Slope of Feather River, North Fork, East Branch, and Spanish Creek.

Locality.	Distance between places. Miles.	Low water elevation.	Fall in feet.
Oroville	0	150	----------
1.5 miles below Middle Fork	6	200	50
Power House Project No. 1	11	535	335
Dam Project No. 1	12	905	370
Power House Project No. 2	2	960	55
Dam Project No. 2	4.5	1,250	290
Power House Project No. 3	4.8	1,470	220
Dam Project No. 3	11.7	2,000	530
East Branch	5.0	2,260	260
Totals	57	----------	2,110
Mouth Spanish Creek	*16.5	2,900	640
Railroad Bridge near Keddie	*2.5	3,045	145

*Distance by railroad.

In the 57 miles from the mouth of the East Branch to Oroville there is a total fall of 2,110 feet, equivalent to an average of 37 feet per mile. In the 40 miles from the East Branch to the power house of Project No. 1, there is a fall of 1,725 feet, or an average of 43.1 feet per mile. The average fall of East Branch from the mouth of Spanish Creek to North Fork is 40 feet per mile.

Available power—From the data on stream slope and minimum flow, the available power with and without storage can readily be computed. The minimum flow used is the average monthly flow in August, 1910, and the horsepower is computed from the equation—Power equals Fall in feet multiplied by Discharge in second-feet, divided by 11.

Minimum Power Available Monthly.

Locality.	Distance between places. Miles.	Total fall. Feet.	Without storage.		With storage.	
			Flow sec.-ft.	Power horsepower.	Flow sec.-ft.	Power horsepower.
From—To—						
Oroville to Middle Fork	7.5	110	1,170	11,700	3,000	30,000
Middle Fork to Power House Project No. 1	9.5	275	970	24,250	2,800	70,000
Power House Project No. 1 to Yellow Creek	38.8	1,675	†835	127,100	2,650	403,500
Yellow Creek to East Branch	1.2	50	665	3,020	2,370	10,770
East Branch to Spanish Creek	*16.5	640	30	1,750	775	45,100
Spanish Creek to Keddie	2.5	145	15	2,180		2,180
Totals	76.0	2,895		170,000		561,550

*Distance by railroad.
†Average of flow at ends of part of stream considered.

From the foregoing it is seen that the portion of the river under consideration affords 170,000 gross horsepower without storage and 561,550 gross horsepower with storage.

North Fork Feather River, immediately above the dam site of the Great Western Power Company.

Feather River Project No. 1 at Big Bend belongs to the Great Western Power Company. It was begun in the fall of 1906 and the first power unit was placed in operation in December, 1908. A tunnel 3 miles in length across the river bend and a timber dam gave an initial head of 420 feet. In 1910, a concrete dam was built a short distance below the original timber dam which increased the head to 442 feet. A detailed description of this power plant is published in the *Journal of Electricity, Power and Gas*, volume 24, page 315. The power house of this plant is now being enlarged by the addition of two 18,000 horsepower Francis turbines, and the head available at the plant is being increased 10 feet by the placing of flash boards on the dam.

The dam of the Big Meadows reservoir now under construction is expected to be completed in 1913. That on Butt Creek is also being constructed. Investigations are being made in the Yellow Creek basin for the construction of that reservoir by the Oro Electric Corporation.

Applications for permits for water-power sites have been made to the Forest Service for four additional power projects on North Fork of Feather River. The location of these projects, together with that of the Big Bend, the Butt Creek, and the Yellow Creek projects, are shown on appended map.

The facts concerning the Great Western Power Company's Project No. 1 or the Big Bend project have been given. Project No. 2 has its head works located in section 6, township 22 north, range 5 east. The diversion dam is projected to 34 feet above low water and the headwater is to be conducted by tunnel down the right bank of the river to a point in the northern part of section 25, township 22 north, range 4 east. The static head on the wheels of this project will be 330 feet. Project No. 3 of the Great Western Power Company is located on the right bank of the North Fork in townships 24 north, range 6 east, and 23 north, range 5 east. The head works are located in sections 10 and 11 of the township first named. The dam will be raised 32 feet above low water to create a pondage area of 76 acres. The water will be conducted principally by tunnel conduit to a point in section 15 of the township last above named and the static head on the power house is 530 feet.

Some of the San Joaquin River watershed, showing rough country.

It appears from the foregoing that the heads on the power house of projects Nos. 1, 2, and 3 will be 1,333 feet under the assumption that the height of the dam of Project No. 1 will be increased 40 feet and that the friction loss of head in that project will be 13 feet. It has been indicated that the fall from the mouth of East Branch to Oroville is 2,110 feet and that from East Branch to the power house of Project No. 1 is 1,725 feet. Thus only 433 feet of the fall from East branch to Oroville, or 20 per cent, is utilized, and in projects Nos. 2 and 3, 860 feet additional, or 41 per cent, are to be utilized. Of the 1,725 feet fall from East Branch to the power house No. 1, 25 per cent is utilized in project No. 1, and about 50 per cent additional will be used in projects Nos. 2 and 3. Thus about 25 per cent of the fall in the 40 miles from the East Branch to power house No. 1 is neither utilized nor applied for.

The Hetch Hetchy Valley, San Francisco's proposed storage reservoir.

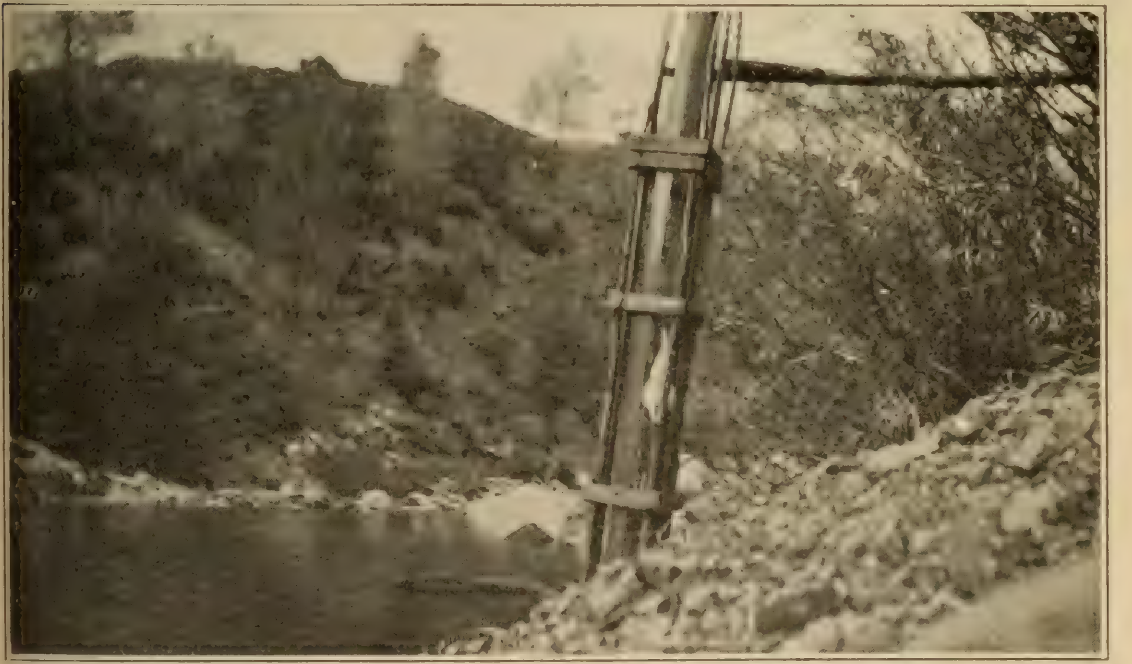
It is the apparent intention of the Great Western Power Company to use every foot possible of the fall in the river between Big Meadows reservoir and the power house of Project No. 1.

Projects Nos. 4 and 5 are located on North Fork above East Branch, It is the intention to use the water in these reservoirs only when the and can be operated only when water is furnished from these reservoirs. flow of the East Branch and other uncontrolled streams will not furnish all the water needed for projects Nos. 1, 2, and 3. Thus it may occur that projects Nos. 4 and 5 will be operated only a few months of each year. Project No. 4 is located on the left bank of the North Fork with head works just below the junction of Butt Creek and the North Fork. The water will be conducted by tunnel to a power house located at the junction of East Branch with North Fork. Project No. 5 consists of a tunnel conduit along the right bank of North Fork leading from the Big Meadows reservoir dam to a point just above the head works of Project No. 4.

The project of the Oro Electric Corporation on Yellow Creek consists of a conduit leading from the proposed reservoir on that creek to a point on North Fork just above the mouth of Yellow Creek.

AMERICAN AND TUOLUMNE RIVER BASINS.

With this report are presented plans and profile surveys of the North, Middle, and South forks of American River and of Tuolumne River. Because of the lack of adequate stream-flow data, no report on power resources can be presented. The gaging stations now being maintained in these basins will, however, within a few years afford all the data necessary.



Float and guide for automatic steam gauge on Tuolumne River, just below South Fork junction. A scale gauge here read once a week for Yosemite Power Co.

SAN JOAQUIN RIVER.

This Commission, at the request of the State Engineer, has entered into a coöperative agreement with the United States Geological Survey for the purpose of making profile measurements and securing such other data as the appropriation will make available, of the San Joaquin River. This work is now being pushed rapidly to completion and will be completed by January 1st. As soon as maps and data are available a supplemental report will be made containing this information.

A leak in the Baldwin Creek syphon of the North California Power Company.

The maps of the profile surveys of the streams referred to accompany this report and are as follows:

Pit River, sheets 1 to 8.
Storage mass curve, Pit River at Big Valley reservoir site, sheet 9.
American River, North Fork, sheets 10 to 22.
Feather River, Middle Fork, sheets 23 to 26.
Tuolumne River, sheets 27 to 32.

STORAGE RESERVOIR SITES IN SACRAMENTO BASIN.

The United States Geological Survey has furnished us with statements of the principal facts relative to storage reservoir sites both available and utilized in the Sacramento basin. These data have been collected in past years principally by the United States Geological Survey and the Reclamation Service. More extended discussions of the storage possibilities on Cache Creek and Stony Brook appear in Water-Supply Papers Nos. 45 and 86, respectively.

PUTAH CREEK.

Putah Creek is the most southerly of the Coast Range streams draining into the Sacramento Valley. This valley was explored by Hubert E. Green, engineer, in July, 1903, for possible reservoir sites. Three sites were discovered.

Guenoc Reservoir—The Guenoc site was the most promising of these, and was surveyed in July and August, 1903. This site is situated in Lake County, in township 11 north, ranges 6 and 7 west, Mt. Diablo Base and Meridian. Guenoc Valley, also known as Coyote Valley, lies in a basin near the headwaters of Putah Creek about 40 miles above the foothills of the southwestern part of the Sacramento Valley. The drainage area above the Guenoc site is about 148 square miles. This watershed is located in the Coast Range, and has several high peaks in the neighborhood, such as Mount St. Helena, Pine, Geyser, Childers, and Round Valley peaks. The elevation of Mount St. Helena is 4,743 feet.

Estimates of cost for the development of this reservoir were made in 1900 by the U. S. Reclamation Service based upon a 100-foot dam with spillway at 90-foot elevation. Such a dam would impound about 145,000 acre-feet. If the dam were raised 10 feet higher, the storage would be increased 45,000 acre-feet. Such a reservoir could be usefully operated to regulate the flood discharge in the Yolo basin.

The dam site is located at the end of a very flat valley of some 3,000 acres. The stream at this point makes a sharp bend and flows for some distance a little west of north, so that the axis of the proposed dam lies in direction north, 70 degrees east. The channel is filled with large boulders and the sides of the canyon have a slope of about 1½ to 1. They are covered with small pines, mountain oaks, together with more or less scrub vegetation. Superficial examination indicates a depth to solid rock of from 4 to 5 feet on the side walls. To rock at the bottom of the stream is estimated to be about 20 feet below the channel bottom.

A natural spillway is afforded for the reservoir about 1 mile southeast of the dam site where a rocky gap divides this valley from an adjacent smaller one. The latter is a marshy lake of some 45 acres area, into which flood waters could be safely discharged, running from this lake back to Putah Creek about 2 miles below the dam site. The length of the proposed spillway would be 740 feet, and with 5 feet over the sill it would be capable of discharging 27,500 acre-feet.

Specifications for a rubble concrete dam made in 1900 are as follows:

Length of dam on crest	450 feet
Width of crest	15 feet
Maximum height	120 feet
Elevation at base of dam	1,070 feet
Elevation at outlet of dam	1,120 feet
Elevation at lip of spillway	1,180 feet
Elevation at crest of dam	1,190 feet
Water slope	5 in 100
Lower slope	75 in 100
Capacity of reservoir	143,300 acre-feet
Weight of rock per cubic feet	167.5 pounds
Total amount of concrete	33,532 cubic yards
Additional rock	11,178 cubic yards
Rock excavation at dam	8,500 cubic yards
Earth excavation at dam	2,000 cubic yards
Rock excavation at spillway	4,000 cubic yards

The estimated cost of this reservoir in 1900 was about $550,000, which should be largely increased to keep pace with increased cost of materials and labor that prevails to-day.

MONTICELLO RESERVOIR SITE.

The Monticello reservoir site is located in Napa County, in township 8 north, ranges 2 and 3 west, Mt. Diablo Meridian, and in Las Putas land grant, and extends westerly from the boundary line between Napa and Yolo counties to a point 1 mile west of the town of Monticello. The dam site is located on Putah Creek at a narrow gorge about 10 or 12 miles west of Winters. Bedrock is exposed on both sides of the canyon, and is apparently not far below the surface of the stream, and is composed of heavy gray sandstone. The stone is being quarried at the dam site and used for building purposes. The weight per cubic foot determined from sample taken from the quarry is 173 pounds.

Because of the large area of improved farming land in Berryessa Valley that would be flooded by back water from the overflow weir or dam during high water, if the elevation of the weir should be fixed at 150 feet, it is believed that the top of the weir should be at the 140-foot contour. The effective storage capacity of the reservoir at this elevation is 99,000 acre-feet. This height has been taken in making the estimate. The elevation of the top of the dam has been fixed at the survey contour of 155 feet, and the wasteways at 140 feet, which is about 130 feet above the stream. The wasteway on the right bank is 100 feet and the one on the left bank 125 feet wide. These will be formed by excavating rock on either side of the canyon for the construction of the dam. With the water at the top of the dam or 15 feet on the weirs approximately 43,000 second-feet would be discharged; with 2 feet of water over the dam approximately 55,000 second-feet would be discharged; and with 5 feet of water over the dam approximately 78,000 second-feet would be discharged. The maximum flood flow of Putah Creek at Winters, on March 23, 1907, was estimated by the Geological Survey at 33,000 second-feet. If the run-off should reach 100 feet per square mile, the maximum discharge would be 51,500 second-feet. The capacity of the reservoir at the 140-foot elevation is approximately 99,400 acre-feet, and at the 150-foot elevation 130,000 acre-feet.

Capacity of Reservoir Site.

Height above bottom. Feet.	Area. Acres.	Capacity between contours. Acre-feet.	Total capacity. Acre-feet.
20	25.1		
		386.0	
Outlet 30	52.1		386.0
		802.0	
40	108.3		1,188.0
		1,196.5	
50	131.0		2,384.5
		2,000.0	
60	269.0		4,384.5
		3,170.5	
70	365.1		7,555.0
		4,346.0	
80	504.1		11,901.0
		5,841.5	
90	664.0		17,742.5
		7,908.0	
100	917.4		25,650.5
		11,004.5	
110	1,283.5		36,655.0
		15,755.0	
120	1,867.5		52,410.0
		21,163.0	
130	2,365.1		73,573.0
		25,822.0	
140	2,799.3		99,395.0
		30,610.0	
150	3,322.7		130,005.0
Total			130.005.0

Capacity at 140 contour	99,395 acre-feet.
Capacity below 30 contour	386 acre-feet.
	99,009 acre-feet.

Average storage capacity, 99,009 acre-feet. Drainage area, exclusive of that above Guenoc site, 455 square miles. Elevation of outlet, 30 feet. The mean annual run-off for the four years, 1906–09, was 601,000 acre-feet.

If the works should be constructed as designed it might be desirable to increase the height of the weirs to 150-foot elevation at some future time, if the demand for irrigation water should justify it. No soundings have been made for bedrock at the dam site. It has been assumed that it will be reached within 30 feet below the present river bed, which is approximately 10 feet in elevation. A rubble concrete overflow dam has been estimated upon. It has been assumed that 70 per cent of the mass of the dam will be large rock (quarried from the spillways), 15 per cent cement mortar, and 15 per cent concrete. There is a large amount of sand and gravel in the stream bed a few hundred feet above the dam site, which can be used for making concrete. In addition to the stability of the dam on account of its weight, it is proposed to construct this as a curved dam with a radius of 320 feet on the upper face.

A portion of land that would be flooded by the construction of this reservoir is in bearing fruit trees with substantial farm houses. Practically all of the town of Monticello would be submerged, a large stone bridge across Putah Creek and a small stone bridge over tributary of Putah Creek near Monticello would be under water, and the lower part of Berryessa Valley.

Specifications.—Curved overflow rubble masonry dam, with spillway.

Elevation of top of dam	155 feet
Elevation of spillways	140 feet
Assumed elevation of bed rock	20 feet
Elevation of outlet	30 feet
Maximum height of dam	175 feet
Capacity of reservoir	99,000 acre-feet
Capacity of 3 outlet gates under 10-foot head	942 second-feet
Capacity when water is 15 feet deep on spillway	3,360 second-feet
Weight of rock per cubic foot is	173 pounds

It has been assumed that 70 per cent of the dam is to be large sandstone blocks, 15 per cent cement mortar, and 15 per cent concrete.

Estimate by Reclamation Service of cost of dam, outlet works, right of way, engineering, contingencies, supervision, and contractor's profits $1,219,075

This is equivalent to a cost of storage works per acre-foot of water of $12.31, which should be largely increased on account of present prices of materials and labor.

CACHE CREEK, CALIFORNIA.

LOCATION AND PHYSICAL FEATURES.

Cache Creek, the only outlet of Clear Lake, is situated in Lake County, California, about 75 miles north of San Francisco. From the lake the creek flows eastward to the corner of Lake, Colusa, and Yolo counties, thence across Yolo County to the sink 8 miles northeast of Woodland.

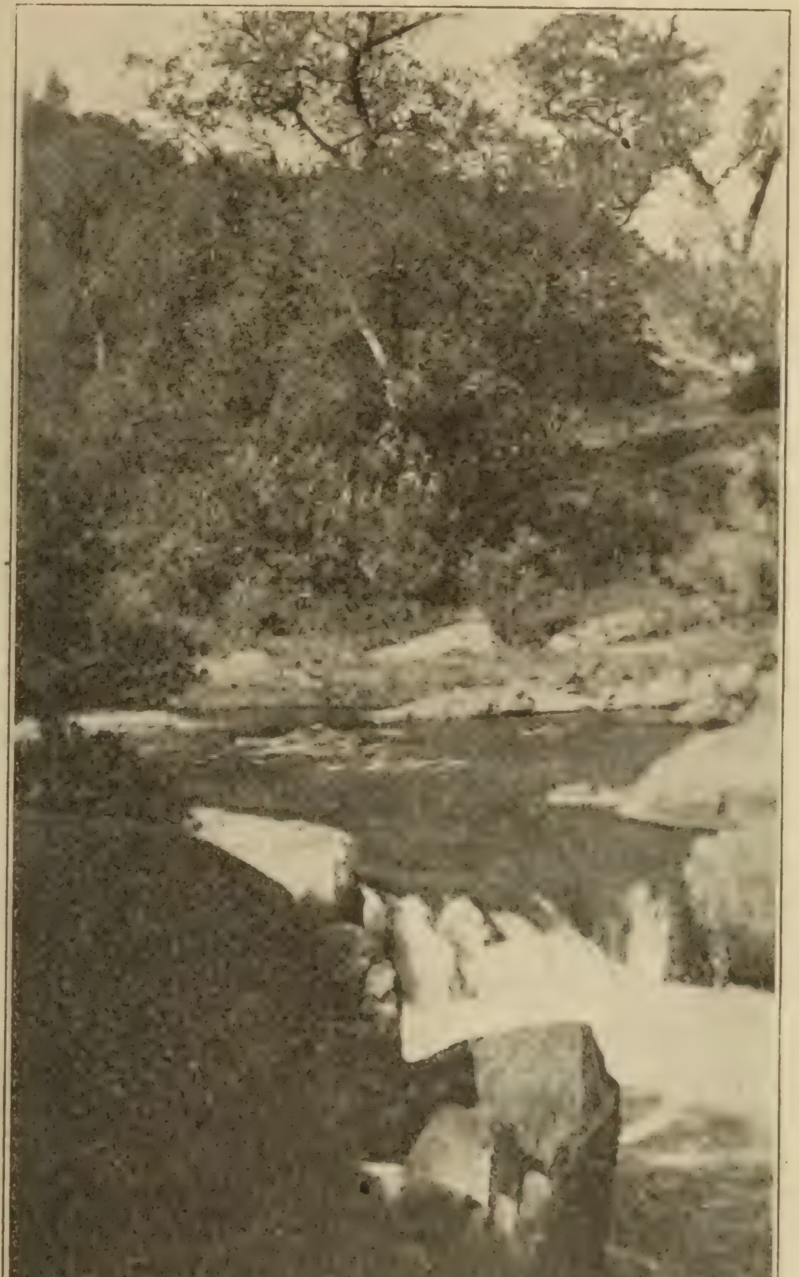
Outlet of Clear Lake, Lake County.

Fourteen miles from the lake the main stream is joined by the North Fork, often called Cache Creek. This branch drains the country to the north and east of the lake, and adds very materially to the drainage area of the creek, but it is much smaller than the stream from the lake and should be considered a tributary.

The drainage area of the main creek and its branches has been estimated by the California State Engineering office as 1,192 square miles.

TOPOGRAPHY.

The country in Lake County tributary to Cache Creek is exceedingly mountainous and rugged. The peaks to the north rise to an elevation of 6,000 feet, and their slopes, as well as those of the lower ranges, may well be termed precipitous. On the northern slopes of the ranges near the lake are magnificent belts of fir, white oak, and yellow pine. Elsewhere, however, the only evidence of vegetation is a dense growth of greasewood and chaparral. The interlaced branches of these shrubs make progress through them painfully difficult, but offer little resistance to escaping rain water.



View of the falls on Cache Creek.

From the Lake, Cache Creek flows through an open country for 5 miles, with a grade of 4.53 feet to the mile. It then follows Cache Creek Canyon for 25 miles. For the first 9 miles of its course through the canyon it has an average grade of 40.33 feet to the mile, varying from 20.41 feet to 137.94 feet. For the remaining distance the average slope is about 30 feet to the mile.

The mountains which form the walls of the canyon rise several hundred feet above the stream, and in many places the immediate banks of the creek stand as perpendicular cliffs 300 feet in height. The bed is generally rendered very rocky by outcropping sandstone and serpentine and the resulting boulders. At no place is there a basin which might be used effectively for storage purposes.

After leaving the canyon the creek enters Capay Valley, in Yolo County, through which it winds for a distance of 28 miles, with a grade of 9.5 feet to the mile. Capay Valley is 20 miles long and from one mile to three miles wide. From Capay Valley the creek enters the greater Sacramento Valley and flows, with a slope of 4 to 6 feet to the mile, to Tule Basin, bordering Sacramento River. There its natural channel ceases, and its waters enter a canal which connects the sink with Tule canal. The latter was built by the State of California in 1864 to drain Tule Basin. It empties into Big Lake in the extreme southeast corner of Yolo County, and from the lake its waters reach the Sacramento through a slough.

"Grigsby Riffle," on Cache Creek, near the junction of Seigler Creek.

Reservoir sites on North Fork of Cache Creek—The North Fork of Cache Creek rises in the mountains north of Clear Lake. Its principal tributaries are Bartlett, Wolf, and Long Valley creeks. Below Long Valley Creek there are no streams tributary to the North Fork. There are numerous canyons down which the storm waters rush after heavy rains, but none in which water can be found in summer. The North

Fork itself generally has no running water in its lower reaches after July.

Reservoir Site on North Fork—The only basins in the North Fork system which might be mentioned as reservoir sites are Twin Valleys, Little Indian Valley, and Long Valley.

The Twin Valleys are situated on a short branch of the North Fork a few miles north of Bartlett Springs. The upper valley is an ideal place for a storage basin; but as the entire catchment area above the valley is only 5 square miles, there would be very little water for storage purposes, and they cannot, therefore, be recommended as reservoir sites.

Long Valley is situated on Long Valley Creek, 2 miles from its mouth. It is 6 miles long, and has an average width of 1,000 feet, and a grade of 25 feet to the mile. Although it has a drainage area of about 30 square miles, the run-off during the drier years, when water is most needed, is stated, on excellent authority, to be very small, as might be expected from experience elsewhere in the same region. Moreover, the valley at its foot, the so-called Narrows, is 700 feet wide. Even should an ample supply be assured, the cost of a dam across the Narrows would be almost prohibitive.

LITTLE INDIAN VALLEY.

Little Indian Valley, the only basin on the North Fork to be recommended as a reservoir site, is 5 miles long, and averages from a half to three quarters of a mile in width. Almost half of the entire area is under cultivation, but the soil contains so much gravel that the grain crops are very light. A small portion of the middle of the valley and near the creek is irrigated for vegetables, a temporary earthen dam being thrown across the stream at a point where the rock outcrops.

A reconnaissance survey of the valley was made to determine its approximate storage capacity, contours being located at intervals of 25 feet, up to the 100-foot level. The following table shows the acreage of each of the four planes, and the storage capacity, in acre-feet, at the intermediate layers; also the total capacity for each contour. The area of the 125-foot contour is estimated to be 1,500 acres, which is considered a minimum figure, as the valley widens very appreciably at its upper end.

Storage Capacity of Little Indian Valley Reservoir Site.

Contour.	Area. Acres.	Capacity. Acre-feet.	Total capacity. Acre-feet.
25-foot	50	625	625
		4,625	5,250
50-foot	320		
		11,875	17,125
75-foot	630		
		20,500	37,625
100-foot	1,010		
		31,375	69,000
125-foot	1,500		
130-foot		7,500	76,500

Clear Lake—For a discussion of Clear Lake reservoir site see Water-Supply Paper No. 45.

STONY CREEK BASIN.

An investigation of Stony Creek basin was carried on in 1900 by the United States Geological Survey in co-operation with the California Water and Forest Association and the Willows Chamber of Commerce. The purpose of the surveys was to determine the location and capacity of reservoir sites, which could be utilized to store the flood waters of this stream so that the land in Glenn County above the Central Irrigation Canal, Sacramento Valley, could be irrigated. Stony Creek basin has peculiar topography. The main stream flows northerly and parallel with the Coast Range, and lies wholly in the sedimentary rock. It is fed by several tributaries which flow easterly from the granite crest of the Coast Range. These tributary streams have a very heavy grade from their source to near the point where they join the main stream and enter the sedimentary rock. At various points in the basin, a conglomerate of more or less hardness is upturned in line parallel with the axis of the main range and has resisted erosion to a very large extent. Wherever this ridge has been cross-cut by the various streams, dam and reservoir sites are found.

Reservoir sites of considerable merit were discovered and surveyed on Briscoe Creek, Little Stony Creek at East Park, subsequently developed by the United States Reclamation Service, and Stony Creek at Mill Site below the mouth of Grindstone Creek. Reservoir sites were also discovered on Grindstone and Salt creeks, but were not considered of sufficient capacity to justify a topographic survey. A site was found on the North Fork of Stony Creek, near the town of Newville, and a plane table survey was made up to the 60-foot contour. The capacity of this site is 25,400 acre-feet at this elevation. The area covered was 1,350 acres. The foundation and abutments at the dam site are not good. a portion of the land that would be flooded is very valuable, and the run-off from the drainage area tributary to the site was not considered sufficient to furnish 25,400 acre-feet annually. The possibility of increasing the water supply by diversion from Thomas Creek was investigated. It was ascertained that the cost of diverting this stream would be too great, but the plan was also not considered advisable because of the fact that a useful reservoir site exists on this stream below the proposed diversion point, which would be greatly damaged by the diversion.

East Park Site—This reservoir site is located on Little Stony Creek at the Lodoga. It has been developed by the United States Reclamation Service for the benefit of the Orland Project. The probable mean annual run-off of Little Stony Creek past the dam site is 98,000 acre-feet. The drainage area above the reservoir is 102 square miles in extent. The dam is of the concrete gravity type, erected to a maximum height of 139 feet. The length of the crest is 220 feet and the contents equal 13,000 cubic yards. The area of the reservoir is 1,800 acres and the capacity, 45,000 acre-feet. The dam has a spillway length of 415 feet at an elevation of 85 feet above the stream bed. The cost of the reservoir is about $4.50 per acre-foot stored.

Briscoe Creek—This creek has a catchment area of 58 square miles of good mountain drainage. The crest of the drainage is a high mountain, locally known as Sheetiron Mountain, and inhabitants of this locality report that it lies in what may be termed a "rainy belt" having a width of about six miles and extending northeast from this mountain about 8 miles. Briscoe Creek, in section 30, township 20 north, range 6 west, Mt. Diablo Meridian, intersects a conglomerate bed in a narrow rocky gorge that is in places only 3 feet wide. The site was surveyed and found to have a capacity of 14,385 acre-feet with a dam 125 feet high. The estimated annual discharge of the stream at the dam site is 55,000 acre-feet. A subsidiary dam at the divide, 1,700 feet north of the dam site, will also be necessary, with a maximum height of 30 feet. The conglomerate at the dam site is very hard. A sample taken weighed 143 pounds per cubic foot. Bedrock is at the surface in the canyon at the dam site, and the walls of the canyon are firm.

A reservoir under construction above Volta, Cal.

In the year 1900 the Geological Survey made a study of three types of dams that were believed to be suited to this site. It was considered that the best type of dam for this place will be a cyclopean concrete gravity dam with a concrete spillway at the subsidiary dam.

The estimate of cost is as follows:

Estimate for dam on Briscoe Creek of type No. 1, concrete dam with wasteway to the north.

Specifications.	Feet.
Length of dam on crest	360
Width of crest	12
Maximum height	125
Radius of crest	300
Elevation at base of dam	60
Elevation at outlet	90
Elevation at crest of spillway	180
Elevation at crest of dam	185
Front slope	½ to 1
Back slope	5 to 100
Capacity of reservoir	14,385 acre-feet
Weight of conglomerate	143 pounds per cubic foot
Estimated total cost	$251,024 00
Cost per acre-foot stored	17 45

On account of increase in the cost of materials, labor, etc., it is probable that the cost of this dam at the present time would be 50 per cent greater than the foregoing figure.

Mill Site—At a point on the main creek in section 1, township 21 north, range 6 west, Mt. Diablo Meridian, locally known as the "Mill Site," the main stream intersects a conglomerate bed. The location is 1¾ miles above the Geological Survey gaging station and 7 miles northwest of Fruto. As it is near the Sacramento Valley, and has back of it over 330 square miles of drainage area, exclusive of Briscoe and Little Stony creeks, this site is relatively important. A dam at this point, 95 feet above the stream bed, would impound 43,700 acre-feet of water. The mean annual run-off for the nine years, 1901-09, is 590,000 acre-feet.

The depth to bed rock is assumed to be 35 feet. The wall rock is not good, and material for concrete would have to be transported 1,600 feet. Owing to these conditions, it was decided to estimate on a loose or rock-filled dam with ample spillway. The dam designed has a top length of 1,240 feet; upper slope 1 to 1¼; lower slope, 1½ to 1; the upper slope to be faced with an earth embankment built against it with a slope of 3 to 1, the width of the rock on the top to be 15 feet and the earth 5 feet, making the finished crest 20 feet wide. The spillway, calculated to carry 36,250 second-feet of water when flowing 8 feet deep over the sill, is 500 feet wide by 10 feet deep, and would be located to the east of the dam through a low saddle, and discharge several hundred feet below the dam.

Estimate of total cost of rock-fill dam at Mill Site, $670,010.00. Cost per acre-foot stored, $15.32.

These costs were estimated in 1900, and should probably be increased 50 per cent on account of increased cost of materials and labor.

Capacity of Mill Site Reservoir.

Contour. Feet.	Height of dam. Feet.	Area. Acres.	Capacity between contours. Acre-feet.	Total capacity. Acre-feet.
55	0	0	0	0
60	5	25.9	130	65
70	15	117.1	715	780
80	25	268.3	1,927	2,707
90	35	398.2	3,333	6,040
100	45	504.6	4,514	10,554
110	55	629.4	5,670	16,224
120	65	798.4	7,139	23,363
130	75	1,029.1	9,137	32,500
140	85	1,231.2	11,300	43,700

Elevation of outlet, 5 feet above bottom of reservoir.
Elevation of spillway, 85 feet above bottom of reservoir.
Capacity, 43,700—65=635 acre-feet.

This water could be used to irrigate the rich foothill lands on the west side of the Sacramento Valley between Orland and Willows.

The capacity of the Mill Site reservoir not being sufficient to impound all of the flow of Stony Creek, a further investigation was made in February, 1901, of the feasibility of diverting a portion of this water into Hambright and Eppinger creeks, small streams rising in the foothills and discharging into the Sacramento Valley. Certain reservoir sites exist on those streams too large to be filled from their drainage basins. The result of this investigation indicated that the cost of the diversion-canal line would be too heavy and the reservoir capacity not sufficient to justify the necessary expense incident to this construction.

GOOSE LAKE.

Goose Lake is situated in Lake County, Oregon, and Modoc County, California. The tributary drainage area is variously estimated at from 1,135 to 1,300 square miles. There are no topographic maps that fix the outline of the portion of the basin in Oregon. This basin is properly a part of the Sacramento River watershed, though no water has probably reached the Pit River from the lake since 1862. In the summer of 1904, Goose Lake covered approximately 186 square miles, or a little more than 119,000 acres.

In July, when the topographic survey was made of the outlet, the surface of the lake was one foot below the highest point in the outlet channel. The evaporation is ordinarily greater than the inflow. Taking the depth of evaporation to be three feet, the loss from the lake surface would be more than 300,000 acre-feet per annum. The above survey was made in order to determine the possibility of draining the lake entirely, or of reducing the area exposed to evaporation, and using the water thus saved for irrigating the lands along the Pit River. A preliminary hydrographic survey was also made to determine the depth of the lake. The soundings taken indicate that the bottom of the lake is comparatively level, and that the slopes near the shore are quite steep. The greatest depth found was 25 feet. The lake will have to be lowered 20 feet to reduce the area to approximately one half its present area.

The following table gives the approximate area and storage capacity of the lake for intervals of 5 feet:

Goose Lake.

(61 square miles in Oregon; 125 square miles in California; total, 186 square miles.)

	Area.		Capacity. Acre-feet.
	Sq. miles.	Acres.	
Lake full	186	=119,000	2,155,000
Lower 5 feet	171	=109,400	1,584,000
Lower 10 feet	161	=103,000	1,055,000
Lower 15 feet	142	= 90,900	568,250
Lower 20 feet	92	= 58,800	193,750
Lower 25 feet	29	= 18,600	Practically nothing

The following analysis of a sample of water from Goose Lake was made at the Agricultural Experiment Station of the University of California:

Analysis of water from lower end of Goose Lake, sample taken August 23, 1904, by S. G. Bennett.

	Grains per gallon.	Parts per 100,000.
Potassium sulphate (very small) Sodium sulphate	18.06	30.91
Sodium chloride (common salt)	7.02	12.02
Sodium carbonate (sal soda)	30.90	52.89
Calcium and magnesium carbonates, etc. (small) Calcium sulphate (gypsum) trace Silica, chiefly	6.99	11.96
Organic matter, large, and chemically combined water	3.79	6.48
	66.76	114.26

"This result shows that the water is unfit for domestic and irrigation purposes."
(Signed) GEO. E. COLBY.

A large amount of the impurities in the water has resulted from concentration by evaporation, as there has been no outflow for about forty-two years. The water flowing annually into the lake is thought to be well adapted for irrigation purposes.

In February, 1905, the state legislatures of California and Oregon passed acts granting the Federal Government the right to drain certain interstate and navigable lakes, including Goose Lake, and relinquishing all rights to the swamp and overflow land thus covered. A bill was also passed by congress granting the U. S. Reclamation Service the right to change the water surface or drain said lakes.

JESS VALLEY RESERVOIR.

The dam site of the proposed Jess Valley reservoir is located on the South Fork of Pit River in section 10, township 39 north, range 14 east, Mt. Diablo base and meridian. The valley has been surveyed for 100 feet in elevation above the level of the stream bed at dam site, which is 100 feet above zero datum of survey and approximately 4,800 feet above sea level. The storage capacity at that elevation is 224,560 acre-feet. The capacity, divided by the area at the 100-foot contour, gives an average depth of 66.56 feet, which indicates the steepness of the sides of the valley. The area of the watershed is 91 square miles. The drainage area includes Eagle Peak, which has an elevation of 9,934 feet. The principal part of the water supply is furnished by melting snow from Warner Mountains. The estimated run-off for the year 1904 was 71,300 acre-feet, which is equivalent to a depth of 14.70 inches over the entire watershed. The maximum discharge was 625 second-feet. The run-off in 1905 was approximately 39,100 acre-feet, or a depth of 7.41 inches. The probable average run-off for the five years 1904-1908 inclusive was 55,000 acre-feet. Thus the capacity of the reservoir is much greater than the supply.

Dam—Provisional plans and estimates have been made for a dam 60 feet high, the outlet level at 10 feet, and the spillway at 50 feet. The effective storage capacity is 81,346 acre-feet. There is practically no sand in this vicinity, so a rock-fill dam, with earth face, has been adopted as a type most suitable for the locality. On account of the scarcity of sand, the same type has been used in making estimates for West Valley, Warm Spring Valley, and Round Valley dams. The spillway would be formed by the excavation of the rock for the dam.

Specifications for rock-fill dam.

Length of dam at crest	305 feet
Width of crest	20 feet
Maximum height	60 feet
Survey elevation of outlet	110 feet
Survey elevation of spillway	150 feet
Capacity of outlet	275 second-feet
Estimated capacity of spillway	10,556 second-feet
(Spillway formed by excavation of rock for dam)	
Earth slope	3 to 1
Upper rock slope	1¼ to 1
Lower rock slope	1½ to 1
Storage capacity	81,346 acre-feet
Weight of rock per cubic foot	168.8 pounds
Contents of rock-fill	35,170 cubic yards
Contents of earth-fill	21,360 cubic yards
Riprap on earth face	42,000 square feet
Contents of cut-off wall, concrete	1,500 cubic yards
Estimated cost of dam, spillway, cut-off wall, outlet works, right of way, engineering supervision and contractor's profits	$196,500 00

Assuming that 35,000 acre-feet can be furnished annually from the reservoir, the cost per acre-foot for the construction of the works will be $5.61. As this estimate was made in 1900, it will probably have to be increased about 50 per cent in order to allow for increased cost of material, labor, etc., at the present time.

WEST VALLEY RESERVOIR SITE.

This reservoir site is located on West Valley Creek, a tributary of the South Fork of Pit River. The area of the watershed tributary to West Valley is, approximately, 142 square miles. The estimated run-off for 1904 was 33,200 acre-feet, and for 1905, 16,200 acre-feet, and probably averaged about 25,000 acre-feet for the five years 1904-1908 inclusive. The valley has been surveyed for 100 feet in elevation above the level of the stream bed at the dam site, which is 100 feet above zero datum of survey and approximately 4,600 feet above sea level. The storage capacity at that elevation is 94,579 acre-feet. The full capacity, divided by the area covered, gives an average depth of 51.12 feet. The sides of the valley are steep. The dam site is located in section 18, township 39 north, range 14 east, Mt. Diablo base and meridian.

Specifications for rock-fill dam.

Length of dam on crest	340 feet
Width of crest	20 feet
Maximum height	70 feet
Survey elevation of outlet	120 feet
Survey elevation of spillway	160 feet
Capacity of outlet	110 second-feet
Estimated capacity of spillway	10,556 second-feet
(Spillway formed by excavation of rock for dam)	
Upper earth slope	3 to 1
Upper rock slope	1¼ to 1
Lower rock slope	1½ to 1
Storage capacity	32,200 acre-feet
Weight of rock per cubic foot	169 pounds
Contents of rock-fill	39,315 cubic yards
Contents of earth-fill	23,515 cubic yards
Riprap on earth face	43,168 square feet
Contents of cut-off wall, concrete	1,450 cubic yards
Estimated cost of dam, spillway, cut-off wall, outlet works, right of way, contingencies, engineering, supervision and contractor's profits	$175,000 00

Assuming that 25,000 acre-feet can be furnished annually from the reservoir, the cost per acre-foot for the construction of the works will be $7.00. This estimate was made in 1904, and in order to keep pace with the increased cost of labor and materials, it will probably have to be increased about 50 per cent.

WARM SPRING VALLEY RESERVOIR.

The area of the watershed tributary to the Warm Springs Valley reservoir is 1,500 square miles, not including the Goose Lake drainage. The estimated run-off from this basin from January 1 to December 31, 1904, was 690,000 acre-feet, which is equivalent to a depth of 8.63 inches. The maximum discharge was 17,000 second-feet. The estimated run-off for 1905 was 156,000 acre-feet, which is equivalent to a depth of 1.95 inches. The mean flow for the five years 1904-1908, inclusive, averages about 423,000 acre-feet. The rainfall for 1904 was unusually heavy and that for 1905 unusually light. The valley has been surveyed 80 feet in elevation above the stream bed at the dam site in the lower half of the valley and 70 feet in the upper portion. The stream bed at dam site was assumed at 100 feet above zero datum of survey and is approximately 4,400 feet above sea level. The 180-foot contour takes in the town of Alturas, the county seat of Modoc County. The total capacity, divided by the area of the water surface at the 170-foot contour gives an average depth of 22.66 feet or 32.3 per cent of maximum depth. In making the plans of the dam, the outlet has been fixed at 20 feet and the spillway level at 60 feet above the stream bed at the dam. The effective capacity of the reservoir is 334,500 acre-feet. The basin may furnish this amount in years of average rainfall. This can only be determined by continuing the gaging records at Canby Bridge. The dam site is located in section 9, township 41 north, range 9 east, Mt. Diablo base and meridian.

Specifications for rock-fill dam.

Length of dam on crest	500 feet
Width of crest	20 feet
Maximum height	70 feet
Survey elevation of outlet	120 feet
Survey elevation of spillway	160 feet
Capacity of outlet	1,115 second-feet
Estimated capacity of spillway	21,110 second-feet
(Spillway formed by excavation of rock for dam.)	
Upper earth slope	3 to 1
Upper rock slope	1¼ to 1
Lower rock slope	1½ to 1
Storage capacity	334,500 acre-feet
Weight of rock per cubic foot	170 pounds
Contents of rock-fill	78,669 cubic yards
Contents of earth-fill	49,646 cubic yards
Riprap on earth face	75,480 square feet
Contents of cut-off wall, concrete	2,500 cubic yards
Estimated cost of dam, spillway, cut-off wall, outlet works, right of way, engineering, supervision and contractor's profits	$670,300 00

Assuming that 334,500 acre-feet can be furnished annually from the reservoir, the cost per acre-foot for the construction of the works will be $2.00. This estimate was made in 1904, and in order to keep pace with the increased cost of labor, materials, etc., it will probably be necessary to increase the estimate by about 50 per cent.

ROUND VALLEY RESERVOIR ON ASH CREEK.

Ash Creek is a tributary of Pit River and enters this stream in Big Valley, near Bieber, California. The area of the watershed of Ash Creek, above the Round Valley reservoir, is 265 square miles. The run-off from this watershed was 160,700 acre-feet in 1904, 54,600 in 1905, and probably averaged about 107,000 for the five years from 1904 to 1908, inclusive. The valley has been surveyed for 100 feet in elevation above the level of the stream bed at the dam site, which is 100 feet above zero datum of survey and approximately 4,460 feet above sea level. At this elevation it would contain 184,700 acre-feet. This is a bowl-shaped basin. The average depth of the water would be 26 feet. The effective storage capacity of the reservoir as planned is 42,500 acre-feet. The height of the dam was fixed at 70 feet, on account of the softness of the rock in sight. It is believed that the basin will supply this amount in years of minimum rainfall. The dam site is located one half mile above Adin, Cal., in section 2, township 39 north, range 9 east, Mt. Diablo base and meridian.

Specifications for rock-fill dam.

Length of dam on crest	740 feet
Width of crest	20 feet
Maximum height	70 feet
Survey elevation of outlet	110 feet
Survey elevation of spillway	160 feet
Capacity of outlet	142 second-feet
Estimated capacity of spillway	7,460 second-feet
(Spillway formed by excavation of rock for dam.)	
Upper earth slope	3 to 1
Upper rock slope	1¼ to 1
Lower rock slope	1½ to 1
Storage capacity	42,400 acre-feet
Contents of rock-fill	101,524 cubic yards
Contents of earth-fill	64,900 cubic yards
Riprap on earth face	104,680 square feet
Contents of cut-off wall, concrete	2,840 cubic yards
Estimated cost of dam, spillway, cut-off wall, outlet works, right of way, engineering, supervision, contingencies, and contractor's profits	$389,000 00

Dam near head of North Battle Creek, Northern California Power Company.

Cost per acre-foot for construction of works will be $9.16+, making the unit price for storage here greater than at any other of the Pit River reservoirs. This estimate was made in 1904, and in order to keep pace with the increased cost of materials, labor, etc., it will probably be necessary to increase the estimate by about 50 per cent.

BIG VALLEY RESERVOIR.

The area of the watershed tributary to the Big Valley Reservoir is approximately 2,950 square miles. If it is found possible to drain Goose Lake and divert the run-off from this basin into Pit River, the drainage area above Big Valley dam site will be about 4,200 square miles.

The mean run-off at Bieber for the five years 1904-1908, inclusive, was about 735,000 acre-feet. The area exposed to evaporation in the Big Valley reservoir, when the depth is 70 feet at the dam, is 83 square miles. Much of the time the reservoir would be only partially filled. The average area exposed to evaporation would probably not exceed 50 square miles.

This is the only dam thus far examined on Pit River where sand is found. The sand at this point is mixed with silt and will have to be washed.

Estimates of cost have been made for a dam 70 feet high above the bed of the stream with a heavy section to carry an overflow weir over part of the crest. It is believed that this will give the reservoir sufficient capacity to store all of the water furnished by the watershed.

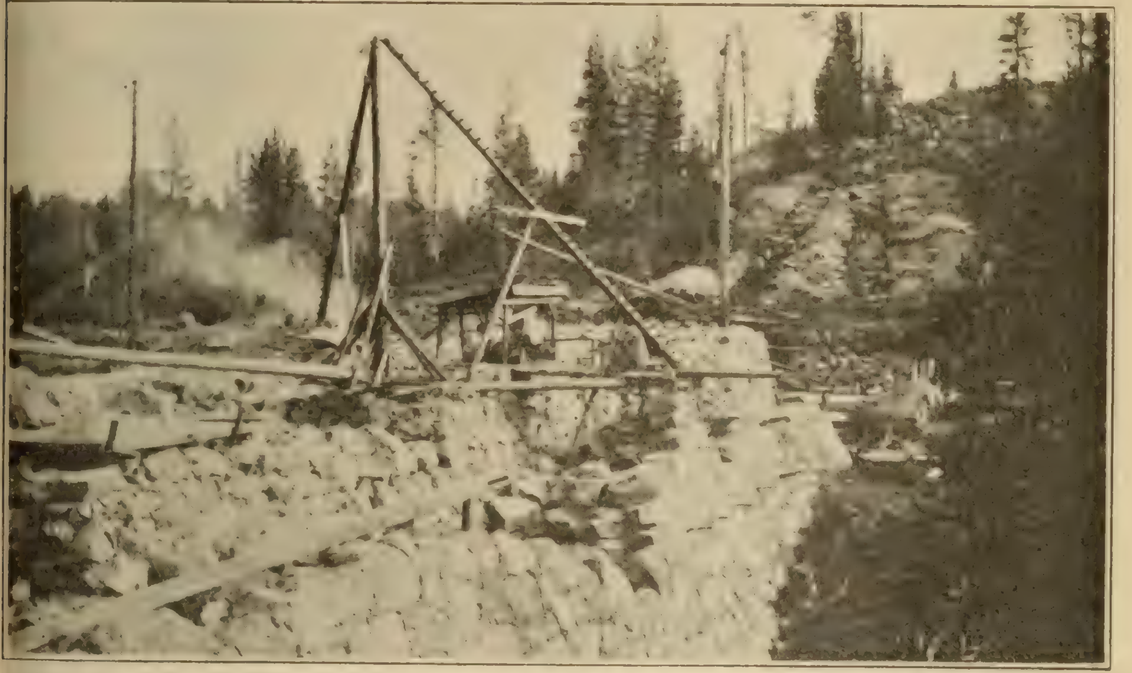
In designing the outlet works, it has been assumed that 1,000,000 acre-feet could be supplied from the reservoir annually. It will be necessary to discharge this amount in five months, or 150 days, which is the usual length of the irrigation season. In order to do this, the outlet must have a capacity of 3,400 second-feet. The design includes ten outlet gates 4 by 5 feet, which will discharge this amount under a 10-foot head. The dam site is located in section 27, township 37 north, range 7 east, Mt. Diablo base and meridian.

Specifications for overflow dam.

Survey elevation of base of dam	80 feet
Survey elevation of stream bed	100 feet
Survey elevation of outlet openings	120 feet
Survey elevation of weir crest	170 feet
Survey elevation of top of dam	180 feet
Height of dam	100 feet
Length on top	535 feet
Width on top	20 feet
Water slope	5 in 100
Lower slope	75 in 100
Capacity of reservoir	1,291,663 acre-feet
Estimate of cost of dam, outlet works, right of way, contingencies, engineering, supervision, and contractor's profits	$2,640,150 00

If the results of the continuation of the stream flow record should justify the first assumption that 1,000,000 acre-feet could be furnished annually from the reservoir, the cost per acre-foot for the construction of the works would be $2.64.

Assuming that 750,000 acre-feet can be furnished annually from the reservoir, the cost per acre-foot for the construction of the storage works would be $3.52. This estimate was made in 1904, and in order to keep pace with the increased cost of labor and materials, it will probably be necessary to increase the estimate by about 50 per cent.



Dam on North Battle Creek, near the head of creek. Northern California Power Co.

SACRAMENTO RIVER—IRON CANYON RESERVOIR.

The Iron Canyon reservoir site is located on the Sacramento River, 7 miles above Red Bluff, California. It was surveyed in September and October, 1903. The estimated effective capacity of this site is 226,900 acre-feet. The elevation of the top contour of the survey was 350 feet. The mean annual flow at this place is many times greater than the storage capacity.

The outlets must have sufficient capacity to discharge 226,900 acre-feet in 120 days in addition to passing 4,000 second-feet for navigation and 3,400 second-feet from Big Valley reservoir, if that should be constructed, or a total capacity of 8,350 second-feet. The gates designed have a capacity of 4,950 second-feet, under a 10-foot head. The cost of additional gates for passing Big Valley water was not included in the estimate.

In order to irrigate nearly 40,000 acres of red foothill and bench land near Red Bluff, which is thought to be particularly well adapted to fruit raising, it may be considered advisable to divert water from the reservoir at an elevation of 330 feet. If this should be done, the effective storage capacity of the reservoir would be 153,900 acre-feet. The advantage gained by making the diversion at this elevation would be a saving of the cost, and making possible the generation of about 16,000 horsepower of electrical energy from the water which it would be necessary to pass through the reservoir for navigation purposes, in addition to irrigating the land mentioned above. The intake tunnel would be about 10,000 feet southerly from the dam and 1,000 feet from spillway No. 2.

Dam—The dam site is located in section 27, township 28 north, range 3 west, Mt. Diablo base and meridian. A rubble concrete dam has been designed for this reservoir. There will be a spillway 1,200 feet in length on the left bank of the river at the dam, and one 600 feet in length located at a divide 9,000 feet southerly from the dam. The elevation of the sill of these spillways is 360 feet. The elevation of the top of the dam will be 370 feet. The combined capacity of the two weirs with 10 feet of water on the sills is 183,600 second-feet.

The difficulties to be contended with in the erection of this dam are the handling of the summer flow of the Sacramento River when putting in the foundations, and in preparing the works to withstand the flood discharge in the winter before the completion of the dam.

On either side of the low-water channel, which is a rock gorge of from 120 to 170 feet wide, there is a comparatively flat area of solid rock between the adjoining hills that form the flood channel. This area on the right bank is approximately 100 feet wide. A canal 100 feet wide with a depth of 10 feet and grade of 1 in 100 would carry 24,200 cubic feet per second.

Specifications for rubble concrete dam.

Elevation of base of dam above sea level	220 feet
Elevation of outlet	270 feet
Elevation of crest	370 feet
Elevation of spillway	360 feet
Maximum height of dam	150 feet
Weight of rock per cubic foot	166.6 pounds
Length of dam	740 feet
Length of spillway No. 1	1,200 feet
Length of spillway No. 2	600 feet
Width of crest	20 feet
Water slope	5 in 100
Lower slope	75 in 100
Capacity	226,300 acre-feet
Preliminary estimate of cost of dam, spillways, outlet works, right of way, engineering, supervision, contingencies, and contractor's profits	$1,855,000 00

The reservoir will hold 226,300 acre-feet of water, which makes the cost for building the works $8.20 per acre-foot stored. This estimate was made in 1904, and in order to keep pace with the cost of materials, labor, etc., it will be necessary to increase the estimate by about 50 per cent.

AMERICAN VALLEY RESERVOIR SITE.

A possible reservoir site exists at American Valley, Plumas County, in township 24 north, ranges 9 and 10 east, Mt. Diablo meridian. For the following reasons it seems doubtful if this site will ever be seriously considered in the near future. Quincy, the largest town and county seat of Plumas County, is located in this valley. The location of a transcontinental railway, the Western Pacific, passes through the dam site. An auxiliary dam 1,800 feet long would have to be constructed at a low divide one mile west of the main dam site.

A contour map of this valley was obtained from Mr. William Watson, C. E. The following table gives the capacity from 3,375-foot elevation to 3,450-foot elevation.

Contour.	Acres.	Acre-feet.	Total acre-feet.
		3,167	
3,375	633.4		3,167
		14,987	
3,400	2,364.1		15,154
		29,889	
3,425	3,613.7		45,043
		41,012	
3,450	4,588.8		86,055
		86,055	

A reconnaissance was made in the eastern part of American Valley, locally known as Thompson Valley, to see if it would be possible to utilize this as a storage reservoir. The width of the valley at the narrowest point is 1,300 feet. The capacity of this site with the greatest depth of water of 50 feet, would be 14,900 acre-feet.

SPANISH RANCH VALLEY.

A reconnaissance was made in September, 1905, of Meadow and Spanish Ranch valleys, located in township 24 north, range 8 east, Mt. Diablo meridian. The grade of the former is so steep that it could not be used for a storage basin. A reservoir of small capacity could be constructed at Spanish Ranch Valley.

The following table gives the capacity of this valley at 25-foot intervals from the 3,600- to 3,700-foot contour:

Capacity of Spanish Ranch Reservoir Site, Plumas County, California.

Contour.	Acres.	Acre-feet between contours.	Total acre-feet.
3,600	0		
		70	
3,625	23.5		70
		949	
3,650	166.3		1,019
		2,615	
3,675	356.8		3,634
		4,835	
3,700	610.2		8,469
		8,469	

Bedrock, which is serpentine, is exposed on the sides of the canyon and in the stream bed at the dam site.

BUCKS VALLEY RESERVOIR SITE.

A reservoir site is located on the west slope of the Sierra Nevada Mountains, Plumas County, in townships 23 and 24 north, range 7 east, Mt. Diablo meridian. Munford's Hill, which lies 5 miles northeasterly of this point, has a mean rainfall of 71.64 inches. The area of the watershed above the dam site is 28 square miles. The run-off from this area in years of mean rainfall would probably exceed 60,000 acre-feet. The principal part of the reservoir site is in private ownership. The dam site and the portion of the valley not in private ownership have been filed upon by private parties as placer mining claims.

The following table gives the capacity of the site:

Capacity of Bucks Valley Reservoir Site, Plumas County, California.

Contour.	Acres.	Acre-feet between contours.	Total acre-feet.
		2,072	
5,120	412.3		2,072
		13,687	
5,140	956.4		15,759
		16,200	
5,155.2 (Flood line)	1,175.2		31,959
		5,884	
5,160	1,276.4		37,843
		37,843	

In addition to its value as a storage basin for irrigation purposes, this reservoir site has considerable value in connection with future power development as Bucks Creek falls 3,000 feet in 8 miles.

GRIZZLY VALLEY RESERVOIR SITE.

A reconnaissance of Sierra Valley and vicinity was made in 1904 by S. G. Bennett. The Reclamation Service was requested to do this work by the inhabitants of this valley, who were anxious to have storage works and canals constructed for the purpose of increasing the irrigated area.

The mean elevation of Sierra Valley is probably 4,875 feet. It contains approximately 144,000 acres of land. There are said to be 25,000 acres under irrigation, the principal part of this being in the vicinity of Sierraville. There is very little alkali in the valley. The soil is a sandy loam. The price of unimproved sagebrush land is from $2.50 to $4.00 an acre. The point from which the people of Sierra Valley hoped to get the principal supply for reclaiming the valley was from the Little Truckee River. A ditch was built some years ago to divert water from this river to the valley, but on account of litigation it was never used. The ditch has a bottom width of 6 feet, and heads on Little Truckee River in township 19 north, range 15 east, Mt. Diablo meridian, near reservoir site No. 1 of the Truckee-Carson Project.

Three reservoir sites in the watershed of the Middle Fork of the Feather River were visited in making the above reconnaissance. These are located at Last Chance Valley, in Last Chance Creek, township 24 north, range 16 east, Mt. Diablo meridian; Graycroft's Neck, on the west side of the Sierra Valley in township 21 north, range 14 east, Mt. Diablo meridian; and Grizzly Valley, in townships 23 and 24 north, ranges 12 and 13 east, Mt. Diablo meridian. The site last mentioned was considered of sufficient value to justify further study and a topographic survey was made in October, 1905, by E. Johnson, Jr. The dam site is located in section 2, township 23 north, range 13 east, at an elevation of approximately 5,800 feet above sea level. The area below the 100-foot contour is 3,151 acres. The valley is used entirely for grazing purposes. The land is of rather poor quality and without improvements. Bedrock, which is granite, is exposed on the surface over the entire area of the dam site.

The following table gives the estimated capacity of the reservoir. Greatest depth of water is 98 feet.

Capacity of Grizzly Valley Reservoir Site.

Contour.	Acres.	Acre-feet.	Total acre-feet.
20	.6		
30	1.5	10.5	10.5
40	20.2	108.5	119.0
50	55.0	376.0	495.0
60	152.3	1,036.5	1,531.5
70	637.8	3,950.5	5,482.0
80	1,404.0	10,209.0	15,691.0
90	2,335.4	18,697.0	34,388.0
100	3,151.0	27,432.0	61,820.0
		61,820.0	

The drainage area tributary to the site is 45 square miles in extent. The run-off from its basin would probably not fill the reservoir to the 100-foot contour in years of low or mean rainfall.

An estimate has been made for a 90-foot concrete rubble dam. For additional safety, the structure would be curved upstream, with a radius of 300 feet at the upper face. The effective storage capacity of the site is approximately 34,300 acre-feet, with the outlet at the 30-foot elevation. The water stored at this point should be used for irrigating land in the Sierra Valley near Beckwith, California, and for a water supply for the town of Beckwith, though it could be used for irrigation in the Sacramento Valley. This land cannot be irrigated from any other source. Sierra Valley is a fertile valley, well adapted to the growing of alfalfa. The principal products of the farmers are oats, barley, wheat, beef, dairy products.

Specifications.

Elevation of base of dam	2 feet
Elevation of top of dam	90 feet
Elevation of outlet	30 feet
Elevation of datum of survey above sea level, approximately	5,800 feet
Width of dam on the crest	16 feet
Width of dam at the base	62½ feet
Length of dam on the crest	240 feet
Capacity of reservoir at 90-foot contour is	34,300 acre-feet
Capacity of outlet under a 10-foot head	116 second-feet
Capacity of outlet under a 60-foot head	284 second-feet
Area of land flooded at 90-foot contour	2,335 acres
Material, rubble masonry, 50 per cent of the mass to be large stones and 50 per cent concrete.	
Estimate of cost for dam, right of way, outlet works, engineering supervision, contingencies, and contractor's profits	$174,843 00

If 20,000 acre-feet are available annually, the cost of the storage works per acre-foot would be $8.74. On account of the increase in cost of materials and labor since the foregoing specifications were made, it is probable that the actual cost would be about 50 per cent greater than the above figures.

MOHAWK RESERVOIR SITE.

The grade of the lower portion of Mohawk Valley was considered to be too steep for the basin to be used as a reservoir. A reservoir site was surveyed by E. Johnson, Jr., in October, 1905, in the upper portion of this valley near Clio.

The following table gives the capacity of this reservoir from the 40-foot to the 100-foot contour:

Capacity of Mohawk Valley Reservoir Site.

Contour.	Acres.	Acre-feet.	Total Acre-feet.
40	1.1		
		69.5	
50	12.8		69.5
		367.0	
60	60.6		436.5
		1,222.5	
70	183.9		1,659.0
		2,392.0	
80	294.5		4,051.0
		3,536.5	
90	412.8		7,587.5
		5,039.0	
100	595.0		12,626.5
		12,626.5	

The results of the survey of this valley were disappointing. Its capacity was very much less than it was thought when the reconnaissance was made. On account of the location of the Sierra Valley Railroad and the town of New Mohawk, or Clio, within the area to be flooded by this reservoir, and because of the value of the other improvements in the valley, it is not considered that this site can be recommended for the location of a storage reservoir in the immediate future.

YUBA RIVER BASIN.

A reconnaissance was made in the watershed of the Yuba River to determine if there were any sites in this watershed suitable for storage reservoirs. No sites of value were discovered. A map of a reservoir site in township 17 north, range 6 east, Mt. Diablo meridian, known as Oregon House Valley, was obtained from the City Engineer of San Francisco. This site was surveyed in connection with the numerous investigations for a domestic water supply for San Francisco, and has a capacity of 90,823 acre-feet.

The following table gives the capacity of the reservoir site with greatest depth of water of 130 feet:

Capacity of Oregon House Valley Reservoir, North Yuba Project.

Contour.	Depth water. Feet.	Area in acres.	Capacity. Acre-feet.
1,480	0	0	0
1,500	20	18.2	182
1,510	30	85.5	700
1,520	40	164.3	1,950
1,530	50	296.8	4,255
1,540	60	460.7	8,042
1,550	70	665.6	13,674
1,570	90	1,097.5	31,305
1,590	110	1,491.5	57,195
1,610	130	1,871.3	90,823

The water supply would have to be obtained from the North Fork of the Yuba River by a diversion canal 9½ miles long, and a tunnel 5½ miles long. It is believed this site would be too expensive for utilization in connection with irrigation.

Twenty-two (22) reservoirs have been constructed in the watershed of the South Fork of the Yuba River. The water is used for mining and power purposes. The capacities of these reservoirs vary from 40 to 21,350 acre-feet. The most important of these were visited to determine if it were possible to increase their capacity by raising the dams. The total capacity of the twenty-two reservoirs is less than 87,000 acre-feet, and it is believed that the amount of storage that could be obtained by increasing the height of these dams would be insignificant. The run-off from the drainage area tributary to some of them is insufficient to fill them in average years. All of the reservoirs are in use except the English reservoir, at which point the dam failed several years ago.

AMERICAN RIVER BASIN.

The watershed of the American River is very precipitous and contains few basins that can be utilized as storage reservoirs. Those that exist are of comparatively small capacity.

View of Folsom Power House on the American River.

The Greenwood reservoir site, located in township 12 north, range 10 east, Mt. Diablo meridian, was surveyed in connection with the Lake Tahoe Project, San Francisco Water Supply Investigation. The water supply for this site was to have been obtained from Lake Tahoe. In order to tap the lake, a tunnel 6 miles long would have been necessary. The capacity of this site is approximately 66,000 acre-feet with a 200-foot dam, and is probably the largest in the American River watershed.

The following table gives its capacity at intervals of 25 feet from 0 up to 200 feet:

Capacity of Greenwood Reservoir, American River.

Contour elevation. Feet.	Elevation of water surface.	Area in acres.	Capacity. acre-feet.
0	0	0	
50	40	43.20	864
75	65	157.94	3,378
100	90	272.64	8,761
125	115	416.39	17,374
150	140	560.12	29,580
175	165	720.55	45,588
200	190	908.52	65,952

RELATION OF STORAGE RESERVOIRS IN SACRAMENTO BASIN TO FLOOD FLOW.

Maps have been obtained of practically all the reservoir sites of economic value for irrigation purposes in the Sacramento basin. There may be other sites of relatively small capacity, which on account of the demand for irrigation water after much of the valley is irrigated and developed, will be of sufficient capacity and value to justify their survey and construction.

The storage basins described in the preceding pages, if constructed, would simplify the drainage problems of the lower Sacramento Valley. The Guenoc reservoir, if constructed, would entirely control the flow from 91 square miles of the watershed of Putah Creek. This area probably has a greater run-off than any equal area in the Sacramento basin.

The Monticello reservoir site is located 4 miles above the point where Putah Creek debouches upon the plain. It is believed that if both of these reservoirs were built the flood flow of Putah Creek could be so controlled that it would seldom exceed 10,000 second-feet.

The construction of Clear Lake and Indian Valley reservoirs would, in a measure, control the flood flow of Cache Creek, if the outlets were regulated with that object in view.

The flood wave of Stony Creek could be effectually controlled by the construction of Mill Site reservoir. Ordinarily reservoirs are allowed to fill with the first rains. The discharge records on Stony Creek show that the flow is many times more than the capacity of this reservoir. The reservoir could have been filled any year since the record began after the first of April. By increasing the outlet capacity and keeping the water low, this reservoir could be used as a regulator of the flood flow through the rainy season until the first of April.

If the Iron Canyon reservoir were built with a large outlet capacity, all ordinary flood waves would be controlled. If built according to specifications given on page 62 it would still have the effect of retarding the passage of the flood crest on account of the large surface afforded, over which the water would be spread and stored before sufficient head was gained on the overflow weir to pass the flood flow.

The Big Valley reservoir of Pit River, if built, could store the entire winter flow from about 4,000 square miles of the watershed tributary to the Sacramento River.

The area of the watershed on the Feather River above reservoir sites which have been surveyed in this basin is 54 per cent of the total drainage area at Oroville, the point where it leaves the foothills. The Big Meadows, Butte Valley, Indian Valley, and Grizzly Valley reservoir sites have sufficient capacity to store, in years of mean rainfall, the entire discharge from 37 per cent of the Feather River watershed.

The Feather River is the largest tributary of the Sacramento River, and its maximum discharge exceeds 100,000 second-feet.

The area of the watershed tributary to the Iron Canyon, Putah Creek, Cache Creek, Stony Creek, Big Meadows, Indian, Butte and Grizzly Valley reservoir sites, is 48 per cent of the total area of the Sacramento basin.

From a study of the available stream flow data it is believed that the Cache Creek, Guenoc, Big Valley, Big Meadows, Butte, Grizzly and Indian Valley reservoir sites have sufficient capacity to hold back the flow from 21 per cent of the watershed of the Sacramento basin during the greatest storms.

Levees for flood protection—In spite of all precautions, crevasses sometimes occur. If a break should occur in the Sacramento levees, after the improvements proposed by the Board of Engineers have been carried out and after the flood basins have been reclaimed and settled, the loss of property might be enormous. There is a possibility of a break being attended with some loss of life. The property loss in one break might be greater than the entire first cost of the reservoirs which have been estimated upon in this report. Because of the intensity and amount of precipitation in the upper Sacramento River basin, its flood waves are great, but are of short duration. On this account the reservoirs will be especially useful in the reducing and retarding of the flood wave crests. It is believed that the additional expense of increasing the outlet capacity and making the reservoirs better adapted to serve the above purpose is justifiable and should be incurred. Inasmuch as levees have not proven universally successful in protecting lands adjacent to rivers from their flood flows, as may be cited in the case of the Mississippi River, it seems desirable to emphasize the important relation that storage bears to the reclamation of overflow lands in the Sacramento Valley.

It seems probable that a complete solution of this problem would require a system of storage reservoirs to control the flood discharge of the main river and its tributaries and thus remove the peaks of flood waves, and add a large safety factor to the stability of the levees.

It is also probable that a material portion of the first cost of such reservoirs might be saved in reducing the cost of levees and other flood-restraining works. It will be seen then how important it is that irrigation of the high valley lands and the reclamation of overflow lands be regarded as a coördinate work. The estimates and plans in this report must be considered as tentative only and likely to change when more detailed surveys are made and more stream flow data accumulated.

Effect of storage reservoirs on the flood of 1907—The rate of flow into the Sacramento Valley during the flood of 1907 largely exceeded the estimate previously used as a basis for computing the proper width of channel to safely carry the flood waters. The width of channel sufficient to carry that flow is so great that the question at once arises whether there is any other solution or partial solution of the problem. Is it not possible to protect the Sacramento Valley by levees against overflow without enormous expenditure for levee structures and a permanent loss of a strip of the best land in the valley, 1,500 to 2,500 feet in width along the river?

Very high flood stages last only a few days. If the rate of flow on these days could be reduced 20 per cent the necessary channel width might be reduced by the same percentage. The storage of a comparatively small proportion of the total flood volume will permit a material reduction in channel width through the whole length of the valley. At once the question is asked: Why cannot the reservoirs proposed for storing water for irrigation purposes be used so as to store the peak of floods and thus partly solve this problem?

Any acceptable scheme for improvement of flood conditions in this basin must include within its purview the interests of irrigation, navigation, and power. The use of a reservoir for flood and for industrial purposes conflicts to some extent. For industrial use it is necessary that the reservoir be full at the end of the rainy season; for flood protection it is necessary that it remain empty until the danger of a flood is past. As already stated, a flood may occur any time from January to the latter part of March. For effective flood protection, the reservoir should remain empty until the middle of March. Many reservoirs would have little value for industrial purposes unless the water were admitted to them early in the rainy season.

It will be instructive to determine the effect that storage in the proposed reservoirs would have had on the maximum rate of flow of some of the streams of the Sacramento basin during the four-day period, March 18 to 21, 1907. The following table gives the capacity of each proposed reservoir, the volume of flood flow for storage on each of these four days and the total.

Flow of streams for period March 18–21, 1907.

Stream and place.	Drainage sq. mi.	Date, March, 1907.					Per cent of flow.
		18th.	19th.	20th.	21st.	Mean 18-21.	
Sacramento—Red Bluff	9,300	118,000	165,000	196,000	132,000	153,000	30.7
Feather—Oroville	3,640	114,000	179,000	120,000	92,500	134,000	27.0
Yuba—Smartsville	1,220	85,000	100,000	60,000	27,000	68,000	13.6
Bear—Van Trent	263	11,400	25,800	13,500	5,620	14,100	2.8
American—Fair Oaks	1,910	70,000	105,000	86,000	72,500	83,400	16.8
Stony—Fruto	601	26,500	20,000	13,500	6,820	16,700	3.4
Cache—Yolo	1,230	13,700	19,200	12,700	7,240	13,400	2.7
Putah—Winters	805	20,200	25,400	8,900	4,850	14,800	3.0
Metered area	18,970	488,800	639,400	510,600	348,530	497,000	100
Unmetered Mountain and Foothills	3,380					*76,000	
Total	22,850					573,000	
Sacramento Valley	4,250					25,000	
Sacramento Basin	27,100					598,400	

*Run-off assumed as 50 per cent of precipitation March 17th to 20th.

It will be noted that some of these reservoirs would have been only partially filled by the flow of March 18th to 21st while others would have stored but a small percentage of the run-off that passed them. A study of this table will show that the four reservoirs in Stony Creek Basin would have stored the run-off from 457 square miles, or 76 per cent of the area above the gaging station, and would have reduced the maximum daily flow from 26,500 to 7,000 cubic feet per second. The two reservoirs in Cache Creek basin would have stored the flow from 609 square miles, or 50 per cent of the area above the gaging station, and would have reduced the maximum daily flow from 19,200 to 14,300 cubic feet per second. The two reservoirs in Putah Creek basin would have stored the flow from 751 square miles, or 92 per cent of the area above the gaging station, and would have reduced the maximum daily flow from 25,400 to 800 cubic feet per second.

The seven reservoirs in Feather River basin would have stored the flow from about 1,515 square miles, or 42 per cent of the area above the gaging station at Oroville, leaving 2,125 square miles uncontrolled. Of this uncontrolled area, 651 square miles are above Mohawk Valley reservoir, and 1,474 square miles are below the reservoirs and above the gaging station. This storage would have reduced the daily flow at Oroville as follows: from 144,000 to 114,000 cubic feet per second on March 18th; from 179,000 to 143,000 cubic feet per second on March 19th; from 120,000 to 90,000 cubic feet per second on March 20th; and from 92,500 to 69,500 cubic feet per second on March 21st.

Big Valley reservoir on Pit River would have stored the entire flow at that place and reduced the daily flow of the Sacramento River at Red Bluff about 25,000 cubic feet per second. The storage at Iron Canyon, together with that on Pit River, would have reduced the greatest daily flow of the Sacramento River at Red Bluff from 196,000 to 143,000 cubic feet per second.

The combined effect on the flow of the Sacramento of operating all of these reservoirs would have been to reduce the maximum daily flow at Red Bluff about 53,000 cubic feet per second; just below the mouth of Stony Creek, 63,000 cubic feet per second; and just below the mouth of Feather River, 92,000 second-feet.

It will be seen that as controllers of floods, some of these reservoirs do not present a very satisfactory showing on account of their location. Less than one fifth of their total capacity would have been in use on the four days of greatest flow and only 8 per cent of the combined capacity of the two largest (Big Valley and Big Meadows reservoirs) would have been in use on these days. If these reservoirs were at a lower altitude and had a larger per cent of the drainage basin above them, they would be more effective in flood control. Nevertheless, they would have very materially reduced the maximum rate of flow.

It will be instructive to indicate from the available records the probabilities of filling these reservoirs after the peak of floods has passed. A seven-year record on Stony Creek shows that the reservoirs in this basin will store the entire normal flow for February or March, but cannot be filled after March. A five-year record on Cache Creek shows that the reservoirs in this basin will store almost the entire normal flow for January and February combined, or for March alone, and can be filled ordinarily in April and May. From a four-year record on Putah Creek, it is found that the reservoirs in its basin will store almost the total normal flow for January and February, or for March, but that they cannot be filled after March. A six-year record on Feather River indicates that the reservoirs in its basin will reduce the normal flow about half in March or April, and that they can be

A view showing the gates controlling the flow of water from the Owens River into the Los Angeles Aqueduct.

filled after April and May. The reservoirs on the Sacramento and Pit rivers will reduce the normal flow in March about one third. With all the reservoirs in operation, the indications are that the normal flow into the Sacramento Valley would be reduced about 44 per cent in March.

Open Canal of the Los Angeles Aqueduct some distance below the Owens River Valley.

MINIMUM RATES OF FLOW IN SACRAMENTO BASIN.

The years 1898, 1899, 1903, 1905 and 1908 have been years of comparatively small run-off in some or all parts of the Sacramento basin. The annual run-off for the years 1898 and 1899 are the smallest of record in the fifteen-year record at Red Bluff. The mean for these two years is only 70 per cent of the fifteen-year mean at this place.

The smallest monthly flow, however, at this place occurred in 1903 when the annual flow was 14 per cent greater than the fifteen-year mean.

The year 1908 was a very dry one in all parts of this basin, the flow being the smallest of record at several of the gaging stations.

The following table gives the least mean rate of flow of record for fourteen consecutive days and for three consecutive months at the several gaging stations. Generally the three-month period includes the fourteen-day period, but not always:

Minimum rates of flow in Sacramento Basin.

Name and place.	Drainage. Sq. mi.	Date. Month.	Year.	Flow in sec.-feet. 3 months.	14 days.
Upper Sacramento River near Red Bluff	9,300	Sept.,	1903	4,250	3,980
McCloud River near Gregory	608	Sept.,	1903	1,313	1,280
Pit River near Bieber	2,950	Sept.,	1905	9	1
Feather River near Oroville	3,640	Oct.,	1902	1,343	1,170
Feather River near Big Bend	1,940	Aug.,	1908	1,062	980
Feather River below Prattville	506	Dec.,	1908	628	578
Feather, North Fork, above Prattville	245	Dec.,	1905	332	320
Hamilton Branch near Prattville	230	Dec.,	1905	178	168
Butt Creek in Butte Valley	73	Aug.,	1908	24	23
Indian Creek, Crescent Mills	740	Aug.,	1908	32	14
Yuba River near Smartsville	1,220	Oct.,	1908	400	320
Bear River near Sheridan	263	Nov.,	1905	23	15
American River near Fair Oaks	1,910	Sept.,	1908	*160	115
Stony Creek near Fruto	601	Aug.,	1902	4	2
Little Stony Creek near Lodega	102	Oct.,	1908	0	0
Cache Creek near Lower Lake	500	Oct.,	1908	11	6
Cache Creek near Yolo	1,230	Sept.,	1908	0	0
Putah Creek near Winter	805	Sept.,	1908	4	3.5
Cottonwood Creek near Ono	52	Aug.,	1908	19	3.2

*In 1905.

It is seen that the minimum flow of all these streams except the Upper Sacramento and McCloud rivers is small. Storage or auxiliary power is necessary to utilize much of the annual flow.

SACRAMENTO, CALIFORNIA
1913

Report of the Reclamation Board of California.

SACRAMENTO, CAL., December 20, 1912.

To His Excellency HIRAM W. JOHNSON, *Governor of California.*

The Reclamation Board of California submits herewith for your consideration a report of its proceedings since its organization and up to December 1, 1912.

The Board was created by act of the special session of the Legislature of 1911, Chapter 25, under suggestion offered by your Excellency in the call for such extra session and in the opening message to the members thereof.

This act formally adopts, on behalf of the State, the plan of flood control for the Sacramento River recommended by the California Débris Commission in its report of June 10, 1910, and approved by the War Department, as fully set out in House Document No. 81 first session, sixty-second Congress. This act gives power and authority to the Reclamation Board to pass upon all plans of reclamation on or along the Sacramento and Feather rivers or in the basins adjacent thereto, whether projected by individuals, associations, corporations or districts, with the evident purpose of having all such plans conform to the system of flood control adopted by the State. Reclamation work may not be done in these basins save with the approval of the Board.

WHY SAN JOAQUIN NOT INCLUDED.

The act, as originally drawn, gave the Board similar authority over reclamation along the San Joaquin River and in the basins adjacent thereto; but it was pointed out that there was at the time neither any Government report nor any plan for flood control of the San Joaquin, nor surveys upon which such a report could be predicated; that the riparian and other interests along the San Joaquin would naturally object to being committed in advance to a plan, not yet outlined, which might or might not be satisfactory to them; and that it would be easy, after an adaquate plan for the control of the San Joaquin had been evolved and adopted by the Government, to place the stream and its basins under jurisdiction of the Reclamation Board, if such course seemed advisable. It was agreed, therefore, not to include the San Joaquin in the original act.

PURPOSE OF FLOOD CONTROL PLAN.

The California Débris Commission plan for flood control aims to maintain in the Sacramento and Feather rivers a constant flow of water for the purposes of navigation and thus to force scouring and deepening of the streams to establish a permanent flood plane beyond which the streams cannot rise; and to so care for flood waters that levees will not be overtopped or broken, with the consequent loss to life and property and to navigation.

These objects are to be accomplished generally by confining the streams within fixed limits, behind strong permanent levees, and by carrying all excess flood waters, after the established flood plane has been reached, out of the rivers and into main by-passes, running through the troughs of the Sutter and Yolo basins to tide water. The mouth of the Sacramento River is to be considerably enlarged to permit of free discharge of flood waters into the bay, and weirs constructed and subsidiary by-passes provided and dredging done wherever necessary.

ESTIMATED COST OF PLAN.

The engineer's estimate of the total cost of the work and purchase of the necessary rights of way, as indicated in the report, is $33,000,000, and the recommendation is made that the cost be apportioned, one third to the Federal Government for the benefits received by navigation, and two-thirds to the State. It has been the general understanding that one-half of the State's portion would be assessed, on some plan not yet formulated, to the property owners benefited by reclamation. California, in adopting this plan, has made more liberal provision for sharing in the expense of river improvements than has any other state in the Union.

Appropriations thus far made for work under this plan by California and the Federal Government have been in equal shares, but such appropriations have been for preliminary work and for dredging at the mouth of the river, which is properly and primarily in the interests of navigation. The appropriations, too, were made under the general plan outlined in the 1907 report, and prior to the 1910 report, which contained the elaboration of the plan and the suggestion as to the State paying two thirds of the expense.

As will be shown, much of the work included in the $33,000,000 estimate, of direct interest to reclamation, has been done and is being done, while more is projected, by private capital under direction of the Reclamation Board and entirely without expense to the State or Nation.

It is not improbable that, in view of the changed conditions and under a modified plan of procedure, the work necessary to be ultimately done by the Federal Government and the State may not exceed in cost one half of the entire amount of $33,000,000; and it will probably be work so clearly necessary in the interests of navigation and not directly associated with reclamation that Congress can find no good reason for objecting to appropriations therefor.

THE STATE'S ACTION OPPORTUNE.

The creation of the Reclamation Board was just in time to save the flood control plan. Already reclamation of individual districts had extended 5,000 to 6,000 feet into the path of the Yolo by-pass as tentatively laid down in the Débris Commission plan, so that even now the line of that by-pass must be moved that much to the west for a large portion of its length or an extraordinary expense incurred in the condemnation of high-priced reclaimed lands and the building of new levees. Preparations had been made by a private syndicate to reclaim a body of 7,500 acres blocking the entire width of that by-pass for several miles; and that and similar obstructive projects have been, under the Board's authority, abandoned or so modified as to conform to and materially assist the general plan of flood control.

THREATENED DESTRUCTION OF THE VALLEY.

Under the conditions obtaining up to the date of passage of this act owners of property anywhere in the basin were at liberty to reclaim practically as they pleased, with such slight restrictions as the various boards of supervisors, acting independently of each other, might see fit to impose. Such restrictions rarely considered the interests of any save immediate neighbors. In consequence, each small reclamation unit, instead of acting along a general plan which would secure safety for all, was intent only on saving itself. It really levied *against* its neighbors, and looked for its own safety through their destruction. The flood plane steadily rose because increased reclamation confined the waters more to the river channels, and there were no by-passes to rapidly carry off floods and no width of channel at the river's mouth sufficient to discharge them. Levees steadily increased in height, adding additional burden to the land. The inevitable end, with a river channel at and below Sacramento City with capacity of but 100,000 second-feet, and record floods of 1907 which, if in crest at the same time, would have sent 600,000 second-feet down to tide-water, must be annual destruction or overtopping of levees with enormous consequent damage, and perpetual danger for all interests in the valley. No possible levees could prevent this result.

CHANGES MADE BY NEW LAW.

The good effect of the act approving the flood control plan and creating the Reclamation Board, with power to force all private interests to conform to a plan which will insure general safety, is already apparent in the eagerness of private capital to embark on reclamation enterprises which previously would not have been considered. That attitude is made still more evident by capital's willingness to do the work at its own expense, even to the extent of dedicating to by-pass uses, without compensation, lands owned by it. Land owners can well afford to adopt this policy since the permanent value created for lands thus leveed can readily stand as expense the actual loss of the acreage included in by-passes. As a matter of fact, however, none of the lands in the by-passes will be, under the perfected plan, subject to conditions worse than are now imposed by nature, while most of such lands will be materially increased in value. The water will flow over them only after the floods have risen beyond the stage fixed by the height of weirs, and it will rapidly pass off, so that most of the by-pass lands can be with safety put in summer crops.

ORGANIZATION AND JURISDICTION OF THE BOARD.

Under the opinion of the State Attorney General of October 14, 1912, a copy of which is hereto appended as Exhibit A, the jurisdiction of the Board extends only to reclamation plans adopted or work commenced later than the day on which the act creating the Board went into effect, to wit, March 23, 1912.

The Board, consisting of W. T. Ellis, Jr., of Marysville; Peter Cook, of Rio Vista; and V. S. McClatchy, of Sacramento, perfected organization on May 25, 1912, by the election of V. S. McClatchy as chairman, and W. T. Ellis, Jr., as secretary.

Since the date named it has held regular meetings on the Tuesday preceding the twenty-fifth of each month, and adjourned and special meetings when necessary. Its rules provide that all cases shall go over one month for hearing and that publication of the application and the date of hearing shall be printed meanwhile in a newspaper of general circulation published within the county in which the proposed district is located or in which the reclamation work is to be done.

ENGINEERING ADVISERS.

The official adviser of the Board in engineering problems is the State Engineer. In harmony, however, with the intent of the act, and to maintain between officials of the United States and of the State necessary and thorough concert of action in matters of flood control in which both have interest and over which both have jurisdiction, Major S. A. Cheney, U. S. A., executive officer of the California Débris Commission, was asked and has consented to advise the Board on engineering questions pertaining to the flood control plan. He has at all times given the Board the benefit of his suggestions and advice, has been present at its meetings, and has used freely the machinery and facilities of his office in assisting the State Engineer and this Board in the preparation of data and the solution of problems incidental to the direction of private reclamation so that it might not interfere with flood control.

COÖPERATION OF CIVIC BODIES AND CITIZENS.

The Board has had, also, the active coöperation of the Flood Control Committee of the Sacramento Chamber of Commerce, which first brought the matter of united action between the State and Federal Government to the attention of your Excellency and the State Legislature, and which has since actively assisted in carrying out the intent of the act. The Board has been aided, also, by the State Flood Control Committee of three which worked at Washington to obtain formal adoption of the flood control plan, such committee consisting of the commissioner appointed by your Excellency, and one representative each from the Chambers of Commerce of San Francisco and Sacramento.

From civic organizations throughout the valley, from reclamation districts, actual and prospective, and from riparian owners have been received cordial endorsement and coöperation.

In short, all interests, National and State, public and private, navigation and reclamation, are to-day united in furthering an accepted plan for control of the Sacramento River, a condition which never before existed.

EFFECTS OF OPENING BY-PASS.

Some fears expressed by interests in Yolo County as to the effect upon lands in the Yolo basin of the opening at this time of the East Sacramento by-pass at Bryte's Bend, as contemplated by Sacramento City, were readily dissolved by statements made by State Engineer W. F. McClure and Major S. A. Cheney, U. S. A., of the Débris Commission, in response to inquiries of the Flood Control Committee. These statements are appended hereto as Exhibits B and C.

An opinion as to legal points involved in this same question was secured by the Flood Control Committee from A. L. Shinn, its secretary. A copy thereof appears in Exhibit D.

AWAITING CROSS SECTIONS OF THE BASIN.

Since the organization of the Board, six months ago, there have been presented to it for approval plans for a number of reclamation projects in the Yolo and Sutter basins, the final disposition of which must wait until cross sections of the basin, now being prepared in the offices of the State Engineer and the California Débris Commission, can be completed, so as to furnish accurate data for the proper location of by-passes. The work for the Sutter basin is practically complete, and that for the Yolo basin, it is thought, will be finished some time in January. Reference is made in this connection to a report which the State Engineer, under direction of the act, is preparing for consideration of your Excellency and the Legislature.

HOW PRIVATE CAPITAL IS AIDING.

The most remarkable and satisfactory progress has been made in the way of assistance to the project by syndicates and new districts, which find it to their interests to do much of the work of construction contemplated in the Government's plan in order to speedily reclaim their own lands and secure a revenue therefrom.

In this way, under applications already formally presented, private capital proposes to do the following work, running into many millions of dollars cost, all such work being included within that figured upon by the Débris Commission in its total estimate of $33,000,000.

1. The formation of two new districts, situated respectively at the

lower and upper end of the Yolo basin. The west levees of these two districts, together with the west levees of intervening districts already constructed, would form a continuous east levee for the Yolo basin by-pass from its discharge point at the southern end to the upper end at the mouth of the Feather River. To take advantage of this condition, the by-pass would have to be located in places from 1,500 to 5,000 feet further west than indicated on the original plan. The cross sections now being made of the basin will determine whether this change can be made without serious disadvantage.

As soon as the Yolo by-pass is officially located there are private interests which have announced themselves, in Board hearings, as prepared to go on with reclamation on the west side of that by-pass and incidentally construct, at their own expense, sections of the west levee of such by-pass.

2. The formation of one or two districts which will reclaim all the unreclaimed portion of the Sutter basin lying between the Feather and Sacramento rivers and extending from the Tisdale weir to the junction of the two rivers, about 75,000 acres. Incidentally there will be constructed without any expense to the Government that entire section of the Sutter basin by-pass, and necessary levees on the two rivers.

3. The city of Sacramento has already voted over half a million dollar bonds to secure the necessary land and construct the subsidiary by-pass at Bryte's Bend, connecting the Sacramento River with the main Yolo by-pass and intended particularly to care for the excess storm waters of the American River.

4. Reclamation districts and owners of unreclaimed lands in Colusa and Yolo counties, aggregating 94,500 acres, have united to construct, at their own expense, if the approval of the Reclamation Board is secured, the Knight's Landing Ridge cut, a canal about eight miles long, which is intended, under the general plan, to drain the Colusa basin into the Yolo basin by-pass.

5. Prior to the organization of the Reclamation Board there was projected and is now in course of construction by the Natomas Consolidated and other districts, in conformity with the flood control plan, levee work on the Sacramento, Feather and Bear rivers, amounting to several million dollars.

All of the work above referred to is part of the flood control plan. If this work be completed it will leave undone comparatively little of the river levee and main by-pass work contemplated by the plan. There will be, in the Yolo basin, the west levee of the by-pass still to be constructed, and in the Sutter basin both sides of the by-pass above the Tisdale weir to Butte Slough, only a short distance. There seems to be no reason to doubt that private capital will find it to its interest in time to complete these portions of the work without expense to the Government.

THE GOVERNMENT'S SHARE OF WORK.

There would be left, to be attended to by the Government and the State under the existing arrangement, sharing the expense equally, the opening of the mouth of the Sacramento River from Rio Vista to Collinsville, now under way; the construction of the Fremont and other weirs; dredging and similar work—all so clearly necessary in the interests of navigation that there should be no questions raised on the part of Congress.

The cost of opening the mouth of the river is estimated at $8,000,000 or $9,000,000. Of this amount $800,000 is now on hand (coming half from the State and half from Congress), and two big dredges, costing about $400,000, are now being assembled. These machines will commence operating in March of next year, and can probably be operated a year or more with the balance of the appropriation. The necessary rights of way have already been secured (with the exception of several small pieces now in process of condemnation), and the cost, $250,000, met by private subscriptions and by appropriations from the city of Sacramento and the State. The work at the mouth of the river will, therefore, go on at the same time as by-pass work to be done at private or municipal expense.

It is probable that the remaining work to be done by the State and the Federal Government under an adjustment of the nature suggested—that is, for construction of weirs, dredging and general river work—will amount to $6,000,000 or $7,000,000. The entire expense thus involved to California under this plan would be $7,000,000 or $8,000,000, and a similar amount to the Federal Government. The entire control plan, also, would reach completion much more rapidly than if Congress had to pay a share of the entire $33,000,000 involved, and make annual appropriations therefor.

POSSIBILITY OF CONGRESSIONAL ACTION.

Congress has not yet formally adopted the flood control plan, though it has made joint appropriations with the State for carrying out portions of the plan at the mouth of the river. To this extent it may be considered committed, as well as by the obligation apparently recognized by the Débris Commission Act of 1893, and the partnership which has since existed with the State in providing funds to evolve a plan to restore the river's navigability.

The plan was presented to the last Congress for consideration, and had hearings before the Rivers and Harbors Committee of the House and the Senate Committee on Commerce. As a large project, new to the committees, and in the face of an appropriation already exhausted, it was passed without recommendation, though its merit was conceded and the obligations of the Federal Government made plain. At this session it is hoped favorable consideration may be had, as the problem presents now a much more favorable aspect, and the Rivers and Harbors· Committee has already referred the Débris Commission's report back to the Board of Engineers for review and a statement of existing conditions. In this way there can be placed before Congress the facts which appear in this report, and which would seem to justify favorable action.

LACK OF FACILITIES.

The Board has been somewhat handicapped in the performance of important duties by lack of facilities. The act creating the Board carried with it no appropriation, save that provided for engineering work to be done by the State Engineer. The traveling expenses of the members of the Board in attending meetings and in viewing projects submitted for approval, as well as the cost of office stationery, minute book, etc., have been paid by the members themselves. For a meeting place in which to hold the hearings of petitioners and those interested in the various projects, there has been used each month such room in the Capitol buliding as the Superintendent at the time could assign. During the legislative session that difficulty will be increased. A stenographic report of the hearings should perhaps be made, but no records of proceedings can be maintained save what appears in the brief minutes. The records in connection with cases before the Board are becoming voluminous, and were for a time kept by the Chairman at his private office, there being no room in the State Engineer's office. They are now kept in a committee room desk assigned by the Capitol Superintendent, but will perhaps have to be moved during the legislative session.

Respectfully submitted.

PETER COOK,
W. T. ELLIS, JR., Secretary.
V. S. McCLATCHY, Chairman.

EXHIBITS.

A. Opinion of Attorney General.
B. State Engineer on Sacramento By-Pass.
C. Maj. S. A. Cheney on Sacramento By-Pass.
D. Opinion of A. L. Shinn on Sacramento By-Pass.

EXHIBIT A.

Opinion of the Attorney General.

SAN FRANCISCO, October 14, 1912.

Hon. W. F. McClure, State Engineer, Sacramento.

DEAR SIR: I have your communication of October 9th, wherein you enquire as to the jurisdiction of the State Reclamation Board to entertain the protest to the approval of certain plans for the reclamation of lands embraced within the boundaries of Reclamation District No. 70. The protest is based mainly upon the ground that if the work is projected in accordance with such plans it will cause material injury to the lands of the protestants.

The act of December 24, 1911 (Stats. 1911, Extra Session, p. 117), which creates the State Reclamation Board, confers upon such Board the power and duty to approve all plans thereafter adopted which include or contemplate both the construction of any levee, embankment, or canal along or near the banks of the Sacramento River or its tributaries or connected therewith, or upon any lands adjacent thereto or within any of the overflow basins thereof."

This act was approved on December 24, 1911, and according to the terms of section 1 of article IV of the Constitution, did not become effective until ninety days after the final adjournment of the extraordinary session of the legislature, which date, I believe, is about March 23, 1912. Any plans adopted by the trustees of the reclamation district prior to such date are free from the operation of the act. All plans proposed thereafter must be first approved by the Reclamation Board before they can be adopted by the trustees of the reclamation district.

I have none of the facts before me which would enable me to advise you definitely as to the duty of the Reclamation Board in this particular case. If the plans were proposed subsequent to the taking effect of the act of December 24, 1911, it is necessary that they be submitted to the State Board for approval and that such approval be had before their adoption by the Board of Trustees of the Reclamation District.

The main purpose of the act apparently is to provide some state control over all reclamation work upon the streams mentioned and thus supervise any local work of reclamation which would interfere with the navigability of the stream or directly or indirectly work injury upon other lands adjacent thereto. No restrictions are placed upon the Board in this respect and its approval or disapproval is left to the sound discretion of its members. The protest is nothing more than notice of anticipated injury and may be considered by the Board along with any other facts which the Board may choose to take into consideration in order to enable it to reach a conclusion as to whether the plans should or should not be approved.

Very truly yours,

U. S. WEBB, Attorney General,
By JOHN T. NOURSE, Deputy.

EXHIBIT B.

State Engineer on Sacramento By-Pass.

SACRAMENTO, September 25, 1912.

Flood Control Committee, Sacramento Chamber of Commerce, Sacramento, Cal.

In the matter of Sacramento by-pass, and answering questions asked by yourself and others under date of September 16th:

First question: "Taking the present levee conditions on the Sacramento River, will the Bryte weir, when installed, increase the water plane in the Yolo basin at any point above that which would exist if the weir should not be installed and no changes in existing levees should be made?"

Answer: "No."

Second question: "If the Bryte weir should not be installed, would the Sacramento River below the weir carry all the flood water that would reach that point, or would breaks occur that would discharge more flood waters into the Yolo basin than would be discharged from the weir?"

Answer: The Sacramento River below the weir would not carry all the flood water that would reach that point, and breaks would undoubtedly occur above that point, which would discharge more flood water into the Yolo basin than will be discharged from the weir when constructed. In other words, the purpose of the weir is that of a regulator.

Third question: "Would any injurious effects upon the land in the Yolo basin be increased by the discharge of the flood water from the Bryte weir at the elevation contemplated?"

Answer: I know of no injurious effects whatever upon the lands of the Yolo basin, which may be increased by the action of the water from the Bryte weir, as proposed to be constructed, as the whole purpose of the construction of the weir is that of regulating in a systematic manner the excess waters of the Sacramento River.

Fourth question: "Taking the natural state of the river without levees as a basis for your opinion, will the Yolo basin be required to carry more water by reason of the Bryte weir than it would have to carry in its natural state, or would the water plane be effected in any way?"

Answer: The Yolo basin would not be required to carry any more water by reason of the Bryte weir than without it; but, on the contrary, the Yolo basin will, upon the completion of the Bryte weir and other improvements of like character proposed by the Débris Commission's report, be, in a measure, relieved of some of the flood water it now carries, because of the deepening of the channel of the Sacramento River, which river will carry considerably more water than it is now doing.

Fifth question: Before the flood plane of the river reaches the projected crest of the Bryte weir, would the Yolo basin be flooded, and to what depth?"

Answer: Yes, the basin would undoubtedly be flooded before a crest of any injurious flood would reach the crest of the Bryte weir; and, as indicated in answers above, the weir itself would be no determining factor in the depth of water accummulated in the basin, as its only purpose is to relieve the channel of the Sacramento River in times of flood.

I am quite surprised that anyone at all familiar with the Sacramento River and the distribution of its waters during flood season should raise any question concerning the construction of any portion of the works proposed by the Débris Commission. As indicated in my answers above, the construction of the weir at Bryte's Bend is an important feature of the whole scheme, a safety valve for the Sacramento River below Sacramento City, affording, as it will, an exit of waters in a systematic manner into the Yolo basin instead of through breaks in levees, as heretofore. If the residents and property owners in the valley will acquaint themselves thoroughly with the project, as outlined in the report of the Débris Commission, they cannot fail, it seems to me, to conclude that, instead of questioning any portion of the works, they should most heartily second every effort in the direction of hastening in every possible manner the consummation of the whole project. Instead of harm coming to the valley through the construction of Bryte weir, it is but the beginning of complete control over the waters which, during present conditions, render the valley practically without value.

W. F. McCLURE,
State Engineer.

EXHIBIT C.

Major S. A. Cheney on Sacramento By-Pass.

SAN FRANCISCO, September 21, 1912.

To Flood Control Committee, Sacramento Chamber of Commerce, Sacramento, Cal.

Subject: Sacramento by-pass and its effect upon the waters of Yolo basin.

Replying to your letter of September 16th, I would make the following answers to the questions asked:

Q. 1. Taking the present levee conditions upon the Sacramento River, will the Bryte weir, when installed, increase the water plane in the Yolo basin at any point, above that which would exist if the weir should not be installed, and no changes in existing levee should be made?

Ans. When the flood reaches a height of about 27.5 on the Weather Bureau gauge at Sacramento, it will begin to discharge over the Bryte weir, the crest of which is planned to be placed at elevation 30.6 U. S. E. D. datum. At this stage of the river the water would be coming over the Elkhorn weir about four feet deep, this weir being at elevation 28.7 U. S. E. D. datum, two feet lower than the proposed weir, the slope of the river accounting for the other two feet. The water would also be coming over through the various breaks in the levees from the Elkhorn district around to district 730 beyond Grays Bend. There are five breaks below Fremont, and one each in Woods Bend and Grays Bend. Yolo basin would, therefore, be flooded from those sources before any water came over the proposed weir above Bryte's Bend. Such water as came over this weir would undoubtedly be added to the water in the Yolo basin, but in the present condition of the banks above and below this point it will not be possible to force the amount of water over this weir that is contemplated in the flood control project.

So the installation of the Bryte's weir at the present time will, if the levees hold below, add but a small prôportion to the total amount of water in Yolo basin. If they do not hold below, the water will not be forced over the weir. Now, the construction of the Bryte's weir is a necessary preliminary to the construction of the Fremont weir, now contemplated in the flood control project, for only when relief for the American River water has been provided at Bryte's can the breaks from the Elkhorn reclamation round to Grays Bend be closed and the Fremont weir installed. The construction of this weir at Fremont will confer a great and general benefit on all the lands in the Yolo basin, and all the reclamation districts fronting thereon, for with its crest at elevation 30 U. S. E. D. datum, which, under average conditions may be considered to correspond to a reading of 21.5 on the Weather Bureau gauge at Sacramento, there would be so many years when there would be no overflow at all into Yolo basin, and the period of such overflow during high water years would be reduced to that time when the stage of the river was above the critical stage, estimated at 21.5 on the Sacramento gauge. The following table shows the number of days that this stage has been exceeded in the last eight years: 1905, 20 days; 1906, 104 days; 1907, 85 days; 1908, none; 1909, 45 days; 1910, 15 days; 1911, 89 days; 1912, none.

From this it appears that the Fremont weir will greatly reduce the ordinary amount of water flowing into Yolo basin. Since the construction of the Bryte weir is a necessary precedent to the closure of the breaks above, and the construction of the Fremont weir, the movement of the city of Sacramento to build the Bryte's weir should be supported by all who are interested in the development of Yolo basin.

Q. 2. If the Bryte weir should not be installed, would the Sacramento River below the weir carry all of the flood water that would reach that point, or would breaks occur that would discharge more flood water in the Yolo basin than would be discharged over the weir?

Ans. During a flood of the magnitude contemplated in the flood control project, it is calculated that the relief afforded by the Bryte's weir will be necessary to hold the water level at the mouth of the American at elevation 35 U. S. E. D. datum, corresponding to about 31.5 on the Weather Bureau gauge. This is two feet above the high water of 1908. There has been a pretty general raising of the levees since 1909, but in several places they have not yet been touched. Now, if the Bryte's weir is not installed the water level would go still higher on such a flood and some of the levees would undoubtedly fall, which would, of course, let more water into Yolo basin than would be discharged over the weir.

Q. 3. What, if any, injurious effects upon the land in the Yolo basin will or can be increased by discharge of the flood water over the Bryte's weir at the elevation contemplated?

Ans. I can think of no injurious effect on the land in Yolo basin due to the discharge of flood water over the proposed weir.

Q. 4. Taking the natural state of the river, without levees, as a basis for your opinion, will the Yolo basin be required to carry more water by reason of the Bryte's weir, than it would have to carry in its natural state, or would the water plane be affected in any way?

Ans. In the natural state of the river, without levees, the river proper carried a smaller proportion of the total flow in flood time than it does now. The aim of the flood control project is to make the river channel carry a still greater proportion of the total flow. Hence, the necessity for the general raising of the river levees. It is expected in the flood contemplated in the project to carry 100,000 second-feet in the river proper past Sacramento. This part of the river has never before carried this amount of water. The Bryte's weir is a safety valve to take off the excess water that cannot be carried in the river channel without endangering the river levees.

Q. 5. Before the flood plane of the river reaches the projected crest of the Bryte's weir, would the Yolo basin be flooded, and to what depth?

Ans. The first part of this question is answered under question 1. It is hardly possible to state to what depth Yolo basin will be filled before the flood plane reaches the crest of the proposed weir, but those familiar with flood conditions may form an idea of the state of affairs from the statement that flow over the weir will begin when the Weather Bureau gauge at Sacramento reaches a reading of 27.5. At such a stage Yolo basin is fully flooded from flow through Elkhorn weir and the breaks above.

(Signed) S. A. CHENEY.

EXHIBIT D.

Opinion of A. L. Shinn on Sacramento By-Pass.

SACRAMENTO, September 27, 1912.

Flood Control Committee, Chamber of Commerce,

GENTLEMEN: Your request for an opinion concerning the legal right of the City of Sacramento to install a by-pass at or near Bryte's Bend is at hand, together with the reports of Major S. A. Cheney, U. S. A., and W. F. McClure, State Engineer.

From these reports it is evident that the material conditions of flood water in the Yolo basin will not be adversely affected by the installation of the by-pass.

As a necessary consequence there can arise no cause of action in favor of persons who will not be injured, and if the reports of the above named engineers are correct no action can be maintained against Sacramento City for constructing the by-pass in the manner contemplated.

Any fears of the result must have arisen from a misunderstanding of the purposes and effect of the by-pass. Another feature of the case arises from the fact that in a state of nature all of the flood waters that rise above the natural banks of the Sacramento River flowed into the basin. Some levees have been constructed which may have limited the overflow of the water to some extent. These levees were made by private parties and reclamation districts, and among such levees are there situated the proposed location of the by-pass.

No persons excepting the owners of these levees have any vested interest therein. The owners can not be compelled to maintain them, and if they do maintain them they have a perfect right to keep them at such height as they choose, so long as they do not change the natural conditions to the detriment of other persons.

The fact that these levees may incidentally have benefited others who did not contribute to their construction does not give such persons any vested right to forever enjoy such benefits, if the owners of the levees see fit to make changes therein for their own advantage.

Outside of the lands required for the location of the by-pass, leading from the river to the trough of the basin, it will not be necessary for the city to consider the effect upon other properties, as they will clearly not be burdened with any more water than nature intended them to bear.

Very truly yours,

A. L. SHINN.

LETTER OF TRANSMITTAL.

State Forester's Office,
Sacramento, California, December 5, 1912.

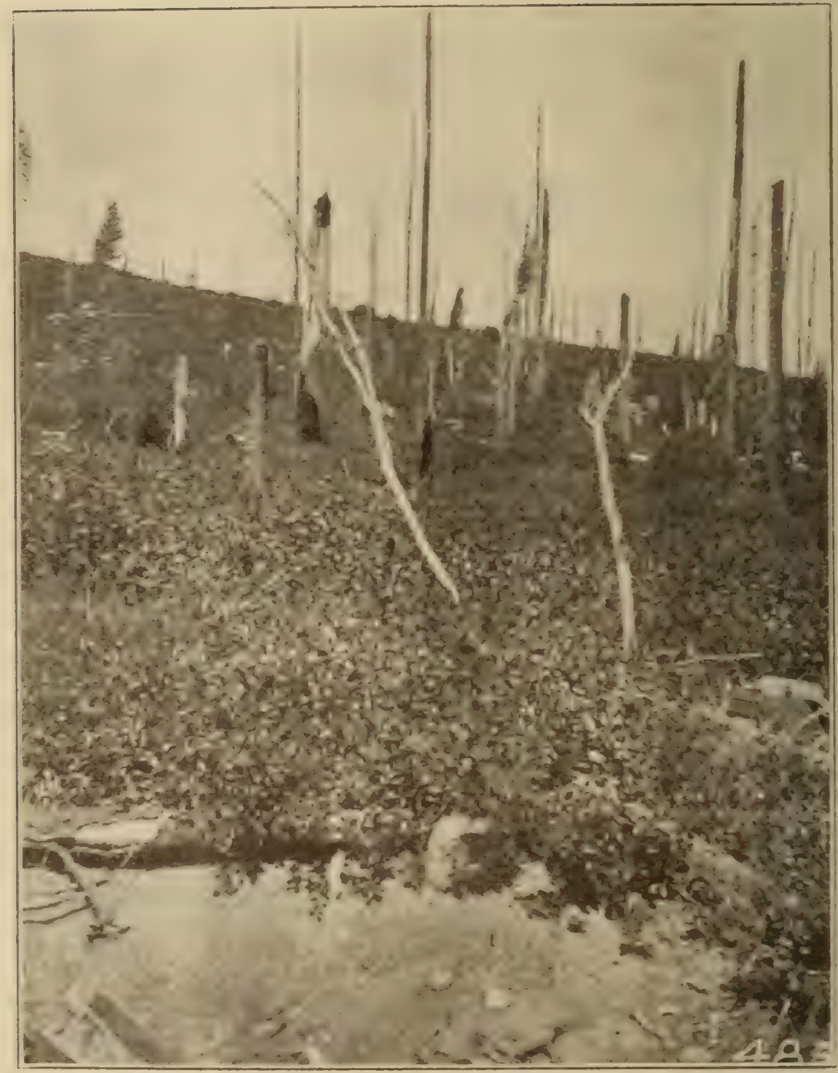
His Excellency,
Hiram W. Johnson,
Governor of California.

Sir:

I have the honor to present herewith a report entitled, "Fourth Biennial Report of the State Forester of the State of California."

Very respectfully,

G. MORRIS HOMANS,
State Forester.



Destructive Lumbering.

Once thickly forested area now a barren waste. Logged too close with no thought for a future crop. Forest fire has completed the destruction and the area is now covered with chaparral which prevents natural reproduction.

INTRODUCTION.

Much of the material contained in this report deals with special forest problems and forest conditions that must be met and solved that a definite and far-sighted state forest policy may eventually be adopted. A limited appropriation has prevented an exhaustive study and investigation, but an effort has been made to show the amount and value of our forest resources; by whom they are owned and how managed; some of the principal forms of waste and damage to which they are subjected; the principles underlying their proper management, and how other states are proceeding with regard to the solution of similar problems.

The National Conservation Congress was held in Indianapolis, October 1 to 4, 1912. Delegates from many states were in attendance, and among them were gentlemen of recognized authority in matters pertaining to the conservation of the natural resources. Some of them were practical exploiters of forest resources; some were scientists who have specialized in various subjects; some were both these, while others were broad-minded, public-spirited citizens interested in the general welfare and betterment of their country. They were all there for a purpose, and here is what they believe in reference to the forests as expressed by the resolutions they adopted:

"Believing that the necessity of preserving our forests and forest industries is so generally realized that it calls only for constructive support along specific lines:

We recommend the work of the Federal Forest Service, and urge our constituent bodies and all citizens to assist upon more adequate appropriations for this work, and to combat any attempt to break down the integrity of our national forest system by reductions in area or transfer to state authority.

Since Federal coöperation under the Weeks law is stimulating better forest protection by the states, and since the appropriation for such coöperative work is nearly exhausted, we urge appropriation by Congress for its continuance.

We recommend that the Federal troops be made systematically available for emergency service in controlling forest fires.

Deploring the lack of uniform state activity in forest work we emphatically urge the crystallization of effort in the lagging states toward securing the creation of forest departments with definite and ample appropriations, in no case of less than $10,000 per annum, to enable the organization of forest fire work, publicity propaganda, surveys of forest resources and general investigations upon which to base the earliest possible development of perfected and liberally financed forest policies.

NEEDED LEGISLATION AND COÖPERATION.

We recommend in all States more liberal appropriation for forest fire prevention, especially for patrol to obviate expenditure for fighting neglected fires, and the expenditure of such effort in the closest possible coöperation with Federal and private protective agencies; and also urge such special legislation and appropriation as may be necessary to stamp out insect and fungous attacks which threaten to spread to other states. We cite for emulation the expenditure by Pennsylvania of $275,000 to combat the chestnut blight, and the large appropriation by Massachusetts to control insect depredation, and urge greater congressional appropriation for similar work by the Bureau of Entomology.

Holding that conservative forest management and reforestation by private owners are very generally discouraged or prevented by our methods of forest taxation, we recommend State legislation to secure the most moderate taxation of forest land consistent with justice of the taxation of the forest crop upon such land only when the crop is harvested and returns revenue wherewith to pay the tax.

We appreciate the increasing support of lumbermen of forestry reforms and suggest particularly to forest owners the study and emulation of the many coöperative patrol associations which are doing extensive and efficient forest fire work and also securing closer relations between private, State and Federal forest agencies. Believing that lumbermen and public have a common object in perpetuating the use of forests, we indorse every means of bringing them together in mutual aid and confidence to this end."

These resolutions are presented for the purpose of showing that forestry propaganda in California is being conducted along constructive and progressive lines.

The chief need in the beginning of a progressive forest policy is the protection of our forests against fire. Some argue that each owner should protect his own holdings while others argue that the State should assume the burden. I incline to the latter opinion. State patrols should be supplemented by private associations of timber owners and by the several counties through their respective boards of supervisors.

The purpose of forestry is to secure the use of our timbered resources in such a way that we ourselves may derive the fullest benefit from them to-day, but also that we may pass them on—unimpaired—so that those who come after us may continue to enjoy the same benefits. To insure this use the forests must be protected. Our forests can be protected from fire under our present laws, provided the legislature makes an appropriation for such a purpose. No change in the existing forest laws is recommended at present.

An effort should be made to secure an appropriation for fire protection and an increase for the support of the board. The latter is needed to conduct special investigations and to continue projects already begun.

If present tendencies remain unchecked, it is apparent that state regulations governing the cutting of timber on private land will be necessary if our forested areas are to produce another crop of merchantable timber. Forestry is not now being practiced on privately owned timbered land. The annual cut is made without reference to the yield, and the future crop is left largely to chance. Further study of the cut-over areas, and of the rate of growth and yield, are necessary before determining what changes can be profitably made by the operators, and what changes are desirable for public good. Legislation, seeking to better present conditions, is likely to be a slow process.

CHAPTER I.

FOREST FIRE.

Fire Report for 1911.

Through the courtesy of the U. S. Forest Service in supplying this office with a list of the fires originating in and near the National Forests, we have been able to complete our record of forest fires for the year 1911.

Fire Season.

The dry season for 1911 commenced no earlier than usual, but continued longer. The first fire occurred in April and the last one in December. The normal fire season is from May 15th to October 15th. August was the worst month, followed by July and November, respectively. Most of the fires occurring between September 1st and December 31st were in the southern portion of the State.

Number and Causes.

There were 1,064 brush, grass and timber fires during the year. Of these, 317 were caused by lightning; 126 were set intentionally; 109 were due to careless campers, and 272 were of unknown origin. The remainder were started in various other ways.

More people go into the woods with each succeeding year, and the chances for starting fires through carelessness will continue to increase. It is right that the use of our forests for recreation be encouraged, but it is essential for the safety of campers, settlers, and property, that proper action be taken to prevent and suppress forest fires.

The following table shows the number and causes of fires during the years 1909, 1910 and 1911:

Causes.	1909.	1910.	1911.
Electric wires	2		
Smoking bees	7		
Blasting	9		4
Hunters	24		
Clearing land	45		
Brush burning		54	66
Engines	64		9
Railroads		17	27
Sawmills		17	17
Tobacco			16
Incendiary	39	70	126
Lightning	79	119	317
Campers	119	122	109
Miscellaneous		76	101
Unknown	250	263	272
Totals	638	738	1,064

Area Burned Over, and Damaged.

The total area burned over by fire was 282,284 acres; 55,182 acres were timbered land and 227,102 acres were brush and grass land. Notwithstanding the fact that the fire season was longer than the average, the total area burned was much less than that of each of the previous two years. This is accounted for largely because of the increased efficiency of the United States Forest Service. More trails and telephone lines have been constructed, enabling the rangers to reach a fire more promptly than heretofore. These improvements make it possible for them to be notified at once of existing fires. A good skeleton of permanent improvement work now exists, and each year's extension lessens the chances for extensive fires.

The actual damage to timber and grazing lands amounted to $128,451.50. There was an unestimated, and perhaps irreparable damage to watersheds.

The following table shows comparative figures for the last three years:

Year.	Area burned over—acres.			Amount of damage.
	Timber.	Open.	Total.	
1909	76,730	279,539	357,269	$100,000 00
1910	216,069	303,394	519,463	628,989 20
1911	55,182	227,102	282,284	128,451 50

During 1911 the Forest Service fought 797 fires at an expense of $63,691.88.

FIRE REPORT FOR 1912.*

Number and Causes.

This office has definite record of 85 fires occurring outside the national forests; these fires were reported by the voluntary firewardens. Of this number 23 were of unknown origin; 14 were caused by hunters and campers (hunters start fires to drive out game and campers usually leave their fires unattended); 14 through careless brush burning; 11 by tobacco and the others were from various causes such as smoking bees, blasting, lightning, sparks from railroad locomotives and from donkey engines not equipped with spark arresters.

Through the courtesy of the Forest Service we are also able to report an additional number of 545 fires occurring within or just outside the national forests, making a total of 630 fires reported so far. These figures are also incomplete since all reports are not in for the entire year.

The total area burned was 92,920 acres. Much of this was timber land and considerable merchantable timber was destroyed.

Of the 85 fires which were reported by the voluntary State firewardens and of which we have definite record, 469 acres of timber land were burned, 30,647 acres of grazing land, and 34,804 acres brush-covered land. Other damage was done to fences, buildings, hay and grain; and, in one instance, several acres of a valuable olive orchard were burned. This direct loss amounted approximately to $12,430. It took 1,908 men, fighting 1,272 hours in all, to extinguish these 85 fires. If these men had been reimbursed for their services at the rate of 25 cents per hour, the State would have had to pay $318.00 for labor. Tools, supplies, and transportation would have been an added cost. The 545 fires reported by the Forest Service cost that institution approximately $20,000.

The first fire of this year was reported in February, and only a few were reported during October. August was the worst month—252 fires occurring during that period.

It will be noticed that a lesser number of fires occurred in 1912 than in 1911. This reduction is very gratifying and praise as well as thanks are due the firewardens who have done so much, and given so much of their time (and often of their personal funds) toward combating fires. The numerous firewardens distributed over the State have had a very beneficial influence. They are all public-spirited citizens and are, for the most part, men of experience and discretion, who, through their earnest efforts, have been instrumental in creating a very favorable sentiment in regard to the careful use of fire in the woods.

Firewardens.

State firewardens serve without compensation for their services and often incur considerable expense. For this they cannot be reimbursed by the State since there is no appropriation for this purpose. It is imperative that the State make an appropriation for fire protection and for paying the necessary expenses incurred when fires do occur. It is unreasonable to ask a volunteer to spend a day, perhaps days, fighting fire, neglecting his personal business, and then not reimburse him for his time and services. At present, this is the deplorable state of affairs. It is right that a man should protect his own property to a reasonable extent, without compensation, the State expects that, but the volunteer who goes out and fights fire does much more. His help keeps the fire from spreading, thereby valuable timber is conserved; he helps to protect the watershed which is so necessary to insure a constant stream flow so that we may have water for irrigation and domestic use, and, in this, the whole State shares the good that results from his efforts, and a system that requires him to give so much is most unfair. Therefore, any sum that the State would spend in this direction would be well and profitably spent.

---

*The figures are complete to November 1, 1912, the date this data was compiled.

So far we have been without an appropriation for forest protection, consequently the State Board of Forestry has been prevented from organizing fire patrols and in taking the first steps necessary to establish forestry principles.

Unless our cut-over areas are protected from fire, it will be impossible to interest private capital in reforesting denuded areas. There are over one and a half million acres of logged-over land that need protection if a second crop of timber is to be grown. Thus far, the work of protection has been undertaken by the voluntary firewardens of whom there are about eleven hundred. These officers have the power of peace officers. They may make arrests for violations of the forest laws and can compel the attendance of citizens to fight fires. . Through their efforts several thousand warning notices have been posted along frequented trails and in camping places, and copies of the forest laws have been distributed among campers and given to others who were interested. In this way coöperation has been sought, and, as far as possible, the danger as well as the proper use of fire has been called to the attention of as many as was possible.

Forest fires in California cannot be altogether eliminated since California has long, dry seasons. Lightning will always be a factor and one that cannot be prevented. But the number of fires can be greatly reduced if an efficient fire patrol system were inaugurated. During the next session of the legislature another strong effort will be made to secure a much needed appropriation for this purpose.

Prosecutions.

Forty arrests for violations of the forest laws were made during the year of 1911. In 21 cases fines were imposed and collected; in 3 cases the offenders were acquitted, and 7 cases were dismissed for want of sufficient evidence. In 6 cases, the fines of the guilty offenders, because of various circumstances, were suspended on condition that similar offenses would not again be committed. The intent in causing forest fires to be started, in two cases, was so malicious that the offenders had to choose between paying a fine or serving a jail sentence. They chose the latter. In other instances, where inexcusable carelessness resulted in fires and the accused were without funds, the justices released them on condition that the fines be paid within a reasonable period. A conviction was secured in the remaining case but no fine collected because of old age. Firewardens did splendid work in bringing the cases to trial, and the justices in prosecuting them.

Many of the wardens realize the uselessness of bringing cases in certain localities because of the attitude of the justices of the peace. There seems to be a peculiar attitude, in some parts of the State, toward forest fires. Their danger is not fully appreciated. The laxity with which many cases are prosecuted is largely responsible for the increase of incendiary fires.

The table on page 12 shows the counties in which the forty cases were tried, and their disposition.

For the year 1912, with the exception of the months of November and December, thirty-nine arrests were made for violations of the forest laws. Of this number, twenty-nine cases were successfully prosecuted, convictions secured and the imposed fines collected. In one case, the offender was acquitted; three offenders were released; two dismissed; in two cases, while fines were imposed, a portion of the fines was suspended; and in the case of another offender, although pleading guilty to the offense with which he was charged, the extenuating circumstances were such that he was placed upon probation for six months in lieu of a fine.

This office has information which tends to show that many of the fires reported were of incendiary origin. They started, for the most part, in remote places and by the time a volunteer fire crew could be assembled and reach the scene, no definite clew could be established.

Stockmen and water users are the heaviest losers. It has been demonstrated that the volunteer firewarden system is inadequate to prevent many of the larger fires and to successfully prosecute the offenders. A paid fire patrol, maintained by the State, must be established.

Violations of the forest laws for not providing donkey engines, locomotives, sawmill stacks and traction engines with spark arresters, are numerous. The origin of many fires, that were not formally reported, could be traced to this source. A systematic inspection of such stacks must be provided for.

The table on page 13 gives a list of the prosecutions to date of November 1, 1912.

FIRE PROSECUTIONS FOR CALENDAR YEAR 1911.

Case.	County.	Tried by.	Place of trial.	Fine.	Sentence.	Remarks.
1	Butte	Justice Storey	Sterling City	$10 00		
2	Butte	Justice Storey	Sterling City	10 00		
3	Butte	Justice Storey	Sterling City	10 00		
4	Butte	Justice Storey	Sterling City	10 00

9	Los Angeles	Justice of the Peace	Los Angeles	50 00		
10	Los Angeles	Justice of the Peace	Los Angeles	50 00		Leaving camp fire unextinguished.
11	Los Angeles	Justice E. Barnes	Claremont	25 00		
12	Los Angeles	Judge Young	Los Angeles			Released.
13	Los Angeles	Judge Young	Los Angeles			Released.
14	Los Angeles	Justice E. Barnes	Pomona	25 00		
15	Los Angeles	Judge McDonald	Pasadena	125 00		
16	Los Angeles	Judge Melrose	Los Angeles	50 00		Fine remitted.
17	Los Angeles	Justice Geo. E. Glover	Los Angeles	25 00		Failure to comply with summons to fight fire.
18	Los Angeles	Justice Geo. E. Glover	Azusa	25 00		Refusing to fight fire.
19	Los Angeles	Justice Geo. E. Glover	Los Angeles			Refusing to fight fire. Released upon proof of physical disability.
20	Mariposa	Justice John Endean	Coulterville	50 00		
21	Riverside	Justice of the Peace	Banning	25 00		Refusing to fight fire.
22	Riverside	Justice Geo. L. Wing	Banning	50 00		
23	Riverside	Justice of the Peace	Riverside	25 00		Leaving camp fire unextinguished.
24	Riverside	Justice of the Peace	Riverside	25 00		Leaving camp fire unextinguished.
25	San Bernardino	Justice Pittman	San Bernardino	10 00		Leaving camp fire unextinguished.
26	San Bernardino	Justice Pittman	San Bernardino	10 00		Leaving camp fire unextinguished.
27	San Bernardino	Justice Pittman	San Bernardino	10 00		Leaving camp fire unextinguished.
28	San Bernardino	Justice Pittman	San Bernardino	10 00		Leaving camp fire unextinguished.
29	San Bernardino	Justice of the Peace	Redlands	50 00		
30	San Bernardino	Justice of the Peace	Ontario			These three men were fined $50 jointly for the one offense of leaving a camp fire unextinguished.
31	San Bernardino	Justice of the Peace	Ontario	50 00		
32	San Bernardino	Justice of the Peace	Ontario			
33	San Diego	Justice J. F. Kelly	San Diego			Dismissed.
34	San Diego	Justice J. F. Kelly	San Diego			Dismissed.
35	San Diego	Justice J. F. Kelly	San Diego	50 00		$25 of this fine was suspended.
36	San Diego	Justice J. F. Kelly	San Diego	50 00		
37	San Diego	Justice J. F. Kelly	San Diego	50 00		$40 of this fine was suspended.
38	San Diego	Justice J. F. Kelly	San Diego			Pleaded guilty. Was placed on probation for 6 months.
39	Yuba	Justice Fraser	Camptonville	50 00		

---

*These figures are necessarily incomplete because all reports are not in for the entire year.

Plate I. Virgin forest.

A typical stand of virgin yellow pine and white fir. This area has been exempt from fire for many years and its density has reached the maximum. The young growth coming in will form the basis for a new crop when the area is logged. A fire would kill all this young growth and do an unestimated damage to the mature trees. Over 5,000,000 acres of virgin timber in California are under private ownership. All of it needs protection.

Protective Associations.

At present three Forest Fire Associations exist in California. They are the Stockmen's Protective Association, the Redwood Fire and Protective Association, and the California Forest Protective Association. The latter two have done but little toward forest fire prevention. They were but recently organized, and it is yet too early to foretell what they will be able to accomplish. On the other hand, the Stockmen's Association has done much and is the strongest of the three associations.

This association was organized on May 15, 1904, by stockmen from Alameda and San Joaquin counties, the object being "to promote the stock and range interests of its members, especially for protection against range fires." The members are assessed one dollar per year and represent 250,000 acres of land. The State Forester coöperates with these associations in every way possible. This association maintains mounted patrolmen during the dry season. These men report regularly to the county firewardens and the State Forester. An efficient system therefore is in vogue and much good is being done.

The Redwood Fire and Protective Association of Fort Bragg is composed of the redwood lumbermen. They have a different problem before them, for the redwood suffers less from fire than other trees. Most of the severe fires of the present time follow lumbering. After the trees are felled the slash and general débris is intentionally fired to facilitate logging. The redwood country is the only region where slash is intentionally fired. The trees are felled, peeled, trimmed, and sawed into logs, then the whole felling area is set on fire. There is a strong sentiment against the use of fire in cleaning up débris, but until some other less wasteful method is demonstrated, the use of fire will be continued. However, the association has done much good in constructing many miles of fire trails in Mendocino County during the past season. This system of fire trails, when completed, will be of great benefit to all owners of timber in that immediate section. All patrolmen in the employ of this association are also state voluntary firewardens. These patrolmen work only during the fire season.

The California Forest Protective Association was organized in March, 1912, by lumbermen representing every section of the State, presumably for the purpose of fire prevention and protection. So far nothing has been done and it will be interesting to note the policies which they may adopt.

County Work.

During the calendar year of 1912 twenty-two counties expended money for forest fire protection amounting to $10,975.07. The amount expended by any one county exceeded $600 in only five cases. Some of the counties coöperated with the U. S. Forest Service and two of them with the Stockmen's Protective Association.

Weeks Law.

Section 2 of the Weeks law authorizes the U. S. Secretary of Agriculture to coöperate with states in protecting forested watersheds of navigable streams from fire. An appropriation of $200,000 was made for this purpose. The law provides that protection must be confined to forested watersheds of navigable streams: the state must have provided by law for a system of forest fire protection; and the Federal expenditure in any state must not exceed, in any fiscal year, the amount appropriated by the state for the same purpose.

The law is carried out by the Forest Service. No state can secure more than $10,000 in any one year. The plan is to assist as many states as possible that the greater educational value may be received. No appropriation having been made for protection, California was unable to avail herself of the provisions of the Weeks law.

Federal Coöperation.

A good framework of protection is already in existence and one that will be most useful to the state when funds are provided.

The federal forest rangers (about 250) serve as voluntary firewardens. The National Forests are patroled, and a few lookout stations have been built. Telephone lines are being extended as rapidly as funds will permit.

During the summer of 1912 the U. S. Post Office Department made provision for lending its support to state officers in the prevention of forest fires. The following order shows in what they are willing to help:

> Order No. 6316.
>
> "*To the Postmaster.*
>
> Sir: The following instructions are promulgated for the guidance of the postal employees concerned:
>
> In accordance with the request of the Secretary of Agriculture, this Department has arranged a plan of coöperation with State and National Forest officers whereby rural and star route carriers shall report forest fires discovered by them along their routes to persons designated by the State and National authorities to receive such intelligence.
>
> The State and National authorities will inform postmasters as to whom the discovery of fires shall be reported, and each rural carrier should be directed to coöperate to the fullest extent with such authorities in the manner agreed upon, namely, that the carrier shall report a fire to the nearest State firewarden or National Forest officer on his route, or if no such officer or warden lives on the route, to arrange through some responsible citizen to have him notified, by telephone, if possible. Star route contractors and carriers are included in the plan of coöperation and should be requested to report the discovery of fires in the same manner as will be done by the rural carriers.
>
> Postmasters in or near National Forests are also directed to report fires to the nearest Forest officer.
>
> Respectfully,
>
> P. V. DeGraw,
> Fourth Assistant Postmaster General."

Rural and star route carriers traverse hundreds of miles of country in the State that is subject to fires. Such assistance will be immensely valuable to district fire rangers and will cost the State nothing. Until paid men are provided for, however, but little advantage can be gained from such generous coöperation.

Organization of Patrol.

The State should be divided into patrol districts; the number depending entirely upon the appropriation available for fire prevention and suppression. A fire ranger will be in charge of each district who shall devote his entire time to patrol, extinguishing such fires as do occur, posting warning notices and in securing the coöperation of those whose business or pleasure takes them into forest or brush-covered regions. Logged-off areas covered with inflammable material or other sources of danger need to be inspected with the view of determining whether they constitute a menace as defined by present laws.

A general educational campaign against fires is most essential. Many of the fires can be prevented by exercising a little more care and, in time, these will probably occur but seldom, or not at all.

Each ranger will have definite headquarters. He will keep a diary and report briefly, at the end of each week, a summary of the work accomplished. In addition, reports, on special forms, will be rendered for each fire attended, showing the area and extent, damage, time required to bring it under control, cost, and probable cause. Similar reports will be rendered for each arrest made for violations of the forest laws. As other duties will permit tentative plans will be prepared by each ranger showing the approximate location of lookout stations and telephone lines that need to be built to insure more thorough and efficient protection. Such work must proceed slowly in order to avoid an unwise choice of location.

The necessity for forests is so generally recognized, and the need for their protection is so well known, that a further discussion is probably unnecessary. There remains the importance of providing funds with which to protect the forest resources of our State.

CHAPTER II.

OWNERSHIP OF TIMBER LANDS.

In order that the people may the more readily determine what state policy shall be adopted to make our forests serve the greater uses to which they can be put, a study of the amount and ownership of timber lands was made during the winter of 1911 and 1912. A type map has been issued showing, approximately, the occurrence of merchantable forests, logged off and chaparral areas. This year, however, each area of 320 acres and over was secured by legal subdivision, county and owner. The data presented in this chapter show the amount of timber and cut-over land that are assessed as such. Agents working under the direction of the State Forester transferred the holdings to our plats as they appeared in each county assessor's office. The discrepancy between the assessed acreage in private ownership and the estimated acreage is accounted for chiefly by the listing, for the purposes of taxation, of much timber land as grazing land. The county assessors will undoubtedly be grateful to have their attention called to such cases of which any one may have special knowledge.

A map showing these holdings could not be published by this department because of limited appropriations, so the data was loaned to the Conservation Commission, which will issue it as a part of their report. The title is "Timbered Area, State of California." The map shows all timber holdings in the State aggregating 20,000 acres or more to the holding.

There are 5,823,440 acres (holdings of 320 acres and over) assessed as timber or cut-over lands. Of this amount, 4,737,554 acres are timbered, and 1,085,886 acres are cut-over land.

The ten largest holdings comprise 2,448,094 acres, or approximately 42 per cent of all the privately owned timber and cut-over land in the State. They are as follows: Central Pacific Railroad (S. P.), 921,311 acres; T. B. Walker and associates, 673,665 acres; McCloud River Lumber Company, 232,063 acres; Diamond Match Company, 159,499 acres; Hammond Lumber Company, 94,760 acres; Union Lumber Company, 80,350 acres; L. E. White Lumber Company, 79,540 acres; Weed Lumber Company, 71,458 acres; C. A. Smith, 69,768 acres, and Sierra Nevada Wood and Lumber Company, 65,680 acres. The holdings under 2,000 acres are too numerous to publish, but they are summarized in the following table:

Summary of timber holdings.

Size of holdings.	Number of holdings.	Amount in acres.		Total.
		Timber.	Cut-over.	
Below 1,000 acres	1,087	460,093	79,071	539,164
1,000 to 2,000 acres	196	195,687	59,321	255,008
2,000 acres and over	286	4,081,794	947,494	5,029,288
Grand total		4,737,554	1,085,886	5,823,440

The table showing the owners, amounts, location by county, of timber and cut-over holdings aggregating 2,000 acres and over to the holding, is omitted because of an insufficient appropriation for printing.

Active lumbering operations are being conducted on many of the properties, and many of the others, including some of the larger ones, are being held for various reasons. The forested area of the State is being depleted very rapidly, and far more timber is being removed annually than is being produced. It is estimated that nearly 5,000,000 acres of once heavily timbered land has, since logging, given way to chaparral growth, and because of cutting without reference to the future, and repeated ground fires, and can not now reproduce another merchantable crop without resorting to artificial reforestation. Under present conditions there is nothing to prevent the continuance of similar methods resulting in similar deplorable conditions.

I am of the opinion that wise and far-sighted State regulations governing the cutting of timber on private lands are of public necessity, and that the lumber industry should be regulated for public good just as other "big business" has been regulated when it was shown that by so doing public interests were the better served as well as preserved. Such measures should accomplish two definite purposes; one being to provide for a continuous timber supply, and the other to conserve water. By accomplishing the latter other beneficial results will follow.

Just how to accomplish desired results is difficult to determine. There is every reason to believe that the state will, eventually, require that timber lands shall be under conservative forest management, and that it will go far toward defining what constitutes such management. Before such a plan can be formulated it is essential that systematic investigations shall continue in matters pertaining to the rate of growth and yield of our commercial forests. So far, students of forestry seem to be unanimous in the opinion that state legislation should be confined for the present to forest protection, taxation, acquirement of state forests, and to education and scientific investigations.

PLATE II. Area logged under Government regulations.

Representative cut-over land in a National Forest. Note the excellent condition of the area. The slash has been carefully piled and burned. Thrifty seed trees of the most valuable species have been left to reseed the area. Nothing under eighteen inches in diameter was cut, so another valuable timber crop is assured.

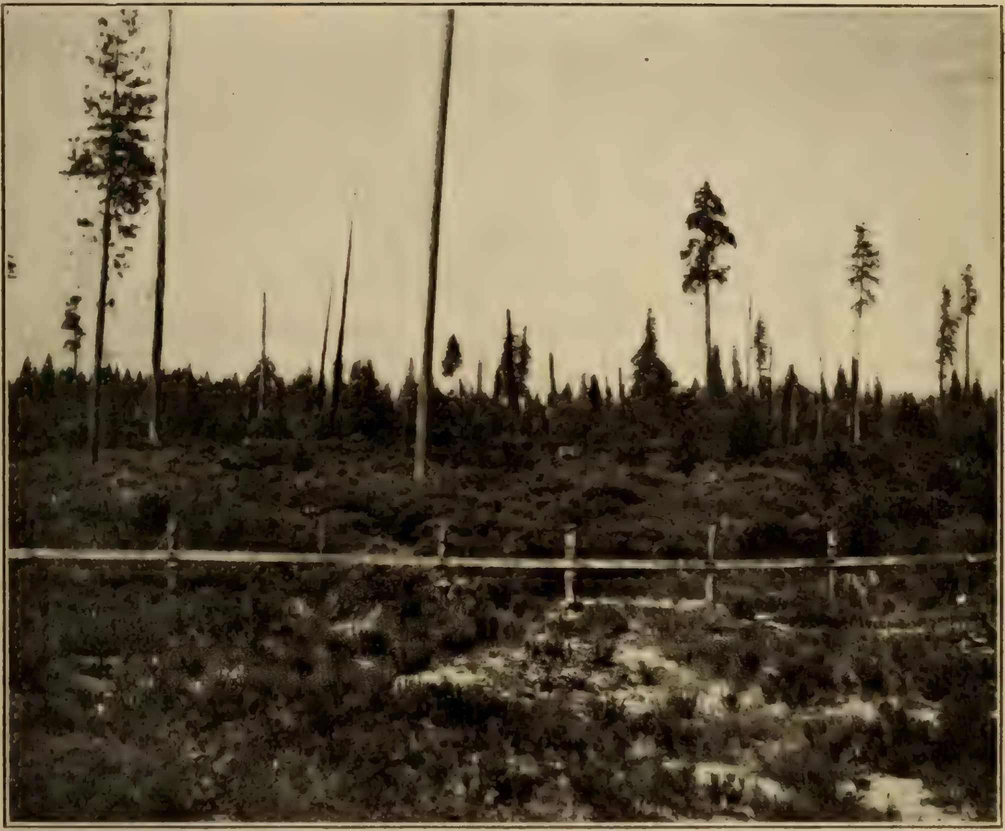

PLATE III. Area logged without restrictions.

Over a million acres of once virgin timber have been "skinned" like the area shown in the picture. Future yield has been left to chance. Such land as this is unfit for anything except the growing of timber. Destructive lumbering has changed the area into a barren waste that is already being claimed by chaparral. A fire would destroy the few remaining trees and give the chaparral permanent possession. With adequate protection these lands will eventually bear another crop of trees.

CHAPTER III.

CUT-OVER LAND STUDY.

Introduction.

With the exhaustion of timber in the New England States, the lumbermen were forced to seek other localities for their source of supply and the region around the Great Lakes became the next great scene of their activities. While operations here were still in full sway, the completion of the transcontinental railroads brought the great belt of timber on the Pacific coast within the reach of the eastern markets. Some of the more enterprising lumbermen, taking heed of the steadily increasing demand for lumber, turned their attention to the vast forest resources of California and began acquiring timber land.

At the time that California was admitted as a State, almost all of the timber land was in the possession of the Federal Government. A few of the original Spanish grants contained some timber land. The early settlers regarded the timber land as being of little value and sought for precious minerals or good ranch sites. As a result, when the lumbermen from the Lake States turned their attention to California, they found that practically the entire timbered area was still in the public domain, and they lost no time in using every available means to gain possession.

Claims were acquired under the Homestead Law, the Timber and Stone Act, the Swamp Land Act, and the mining laws. The public land laws were violated to such an extent and so openly that they accomplished little else than ridding the people of their natural heritage. Timber frauds were perpetrated more and more openly. Dummy locators were imported by the score from eastern cities. Some of them could scarcely understand English, yet they were "located" on choice timber claims with the agreement that the locators should gain possession upon the issuance of patent. The dummy seldom resided on the land—that was unnecessary. From $100 to $300 was the prevailing price paid for the title to such claims.

Most of the choice timber lands were appropriated before the Government awoke to the fact that urgent action was necessary if it wished to preserve any of its timber. On March 3, 1891, a law was passed which enabled the President to withdraw timber lands from the public domain, and set them aside as forest reserves. At the present time there are 27,557,393 acres of land in the National Forests of California. Of this amount 7,786,306 acres are timber land and 4,317,904 acres are woodlands.* This area has a stand of approximately 114.4† billion feet B. M. of timber worth on the stump about 228 million dollars.

There are about 8½ million acres of privately owned timber land. They contain 248.1† billion feet B. M., and they are worth more than 500 million dollars.

The purpose of this study is to bring before the people of California the exact conditions prevailing on our cut-over lands. The redwood lands present a problem peculiar to themselves and have not been considered in this study.

The cut-over lands must furnish the future timber supply. At the present rate of cutting our supply of standing timber will be exhausted in a few generations. The growing of a crop of timber is essentially a long time investment, and under the present system of taxation, one that the lumberman does not feel able to undertake. The extremely close cutting now being practiced by most companies is probably due in part to our system of taxation. In another part of the report, the evils of this system are fully discussed, and it is shown how private reforestation is discouraged.

A large proportion of this cut-over land is unfit for anything except the growing of timber, but if a future stand is to be produced, it must eventually fall to the State to undertake the work.

One of the most important factors in the work of reforestation is fire protection. The results of this study show conclusively that much of the cut-over land will reforest itself naturally from a very few seed trees if fire is excluded. In the investigation that was carried on, particular attention was paid to (1) Fire protection systems or lack of protection; (2) Unnecessary waste in logging; (3) Damage to the watersheds; (4) The condition in which the lands were left after cutting, and (5) What was being done with the lands after logging.

---

*Figures compiled by the U. S. Forest Service.

†"The Lumber Industry," Bureau of Corporations, 1911.

A preliminary investigation was made in the winter of 1911-12 to determine the area and ownership of the timbered and cut-over lands of the State. In securing this total, all holdings of over 320 acres were considered. It was found that in all there are 4,737,554 acres of timbered land and 1,085,886 acres of cut-over land in private ownership. Excluding the redwood lands, there remains approximately 3,600,000 acres of pine timber land and 825,000 acres of pine cut-over lands. Inadequate appropriations would not permit of a detailed study of all this area, but ten lumber companies were selected, representing a total of 552,303 acres of which 365,545 acres are timbered land and 186,758 acres are cut-over land. A careful examination was made on these holdings and the conditions found may safely be said to be representative of those prevailing throughout almost all of our pine lands.

Forest Composition.

The timbered areas studied are representative of the commercial forests extending from the Oregon boundary, south through the Sierra Mountains to the southern extremity of their natural range. They necessarily vary in composition, density of stand and quality of timber. Yellow and sugar pines predominate and are the more valuable species. They occur scatteringly, in association with other species on some areas, and form pure stands on others. South of Mount Shasta yellow pine gives way to sugar pine, Douglas fir, white fir and incense cedar, which, together produce a mixed stand, varying in the proportion of species according to topographical, soil and moisture conditions. Jeffrey pine makes its appearance on the higher elevations from Sierra County south to Fresno County.

Douglas fir occurs most extensively in the north where it often predominates on the north and east slopes, while the bigtree is confined to the southern region.

OCCURRENCE OF SPECIES.

Yellow pine (*Pinus ponderosa* Lawson).

Yellow pine occurs throughout the entire area, either in pure stands or in mixture with other species. It occurs on all soils and on slopes of all inclinations and aspects. However, it is not found in great abundance on the north slopes, but does best on the benches and gentle slopes on the west slopes of the Sierra. In its best growth it reaches a maximum diameter of six to seven feet and a maximum height of 175 to 200 feet. Its bole is cylindrical, with a slight taper and is usually clear for about one half its length. It bears seed annually, but best seed years occur every three to five years. The seed has a high percentage of germination and the seedlings will grow wherever there is sufficient light.

Sugar pine (*Pinus lambertiana* Dougl.).

Sugar pine was never found growing in pure stands, but always in mixture with some other species. It occurs usually at the higher elevations and was not noted below 3,000 feet. At the lower elevations it was found chiefly in mixture with yellow pine and incense cedar. At the higher elevations, white fir and yellow pine were its chief associates and in the south it was also found in mixture with the big trees. It was found on a variety of soils, but made its best growth in cool, moist situations on north and east slopes and in cañons and ravines. In its best growth it reaches a maximum diameter of 6 to 7 feet and a maximum height of 160 to 180 feet. A little seed is produced locally each year, but good seed years are irregular, generally from four to seven years apart.

Jeffrey pine (*Pinus jeffreyi* "Oreg. Com.").

Jeffrey pine is similar in size and appearance to the western yellow pine. It occurs commonly between the upper altitudes of western yellow pine and of white fir, with no sharp line between its range and the ranges of these trees. The best commercial growth is made between 5,000 and 6,500 feet elevation, on well-drained, loose, sandy soil, with abundant moisture. It was found occasionally in nearly pure stands and often predominating in mixture, where it associates chiefly with western yellow pine, lodgepole pine, sugar pine, white and red firs, and incense cedar.

Douglas fir (*Pseudotsuga taxifolia* (Poir.) Britt).

Douglas fir was found chiefly in association with yellow pine, sugar pine, white fir, and incense cedar. It occurs on all slopes, but seems to prefer the sheltered slopes and cañons to the more exposed situations. It was noted in almost pure stands on the steep north exposures in the Castle Creek watershed, Shasta County. In this State it attains a maximum diameter of 4 to 6 feet and a maximum height of 125 to 150 feet. From north to south, the per cent of Douglas fir decreases, and very little was found in the southern part of the area examined. It grows on a variety of soils, but demands considerable soil moisture and humidity to make a good growth. It produces seed every year, and especially good seed years occur at intervals of about three years.

White fir (*Abies concolor* (Gord.) Parry).

White fir was noted in every tract that was examined. It occurred on a variety of soils, but appeared to prefer the moist situations, and made its best growth on rich, moist loam. It is a large tree, often attaining a diameter of 4 to 5 feet and a height of 150 feet in the most favorable situations. It is usually found in mixture with yellow pine, incense cedar, sugar pine, and Douglas fir. In the southern part of the State it was noted in mixture with the big trees and sugar pine. Except in dense stands, it does not clear itself over one third to one half its length, and in many instances its lower branches are found clinging in a dry mass around the trunk. It is a good seeder and produces some seed every year. Good seed years occur every two or three years. The seed will germinate in almost any kind of seed bed and this fact renders it aggressive for reproduction on cut-over lands.

Incense cedar (*Libocedrus decurrens* Torrey).

Incense cedar was never found in pure stands, but usually occurred as a subordinate tree in mixture with other species. In the northern part of the State, it was found forming a small part of an otherwise pure stand of yellow pine. It was also found in mixture with yellow pine, sugar pine, Douglas and white fir. It grows on a variety of soils, and while it prefers cool, moist soils, it will grow on very dry situations. It has a rapidly tapering trunk and seldom reaches a height of over 100 feet. The maximum diameter noted was about 4 feet. Considerable seed is borne locally each year, but especially good seed trees occur every two or three years.

Tolerance.

By tolerance is meant the ability to endure shade. A tolerant specie is one capable of enduring more or less heavy shade, and an intolerant specie is one that is unable to endure shade. Successful reproduction depends not only on a proper distribution of seed, but also on the conditions for germination and for the development of the seedlings. In order to fully understand what constitutes the proper conditions, it is necessary to know which species are tolerant and which are intolerant.

The criteria used in judging the tolerance of a specie are its ability to endure shade, its method of branching in close stands, and its habits of retaining living branches. A tolerant species usually had heavy foliage with living branches, in dense stands, extending well down the bole, while an intolerant species in a dense stand has a clean bole with a small crown.

Sugar pine.

This specie will stand considerable shade for the first ten years, after which it requires a direct light. As it approaches maturity, it becomes very intolerant, even more so than the yellow pine. It prunes itself well, especially in dense stands.

Yellow pine.

The yellow pine is intolerant throughout life. In the seedling stage it will endure a certain amount of shade, and the young trees are often found in dense thickets. After they reach an age of from ten to twenty years, they thin out rapidly and the trees over 20 feet high demand light.

Jeffrey pine.

Jeffrey pine is fairly tolerant when young, ranking between yellow and sugar pine. Its seedlings and saplings make a fair growth under partial shade. In later life it becomes as intolerant of shade as western yellow pine.

Douglas fir.

Douglas fir is moderately tolerant throughout its life. In the seedling stage it appears to demand a partial shade but it becomes less tolerant as it approaches maturity.

White fir.

This species is very tolerant, more so than any of the other species studied. Owing to its great tolerance, it cleans itself poorly, and retains its lower branches even in dense stands.

Incense cedar.

This species is next to white fir in tolerance. It is found in the seedling stage under dense shade, but it requires more light as it grows older.

Reproduction.

The seedlings of the sugar pine were found in greatest abundance on well-drained sandy, black loam areas where there was a considerable amount of humus. The seeds scatter in bunches near the old trees. Trees under 20 inches in diameter do not produce much seed. It is not a prolific seeder. Some seed is produced locally each year, but seedling counts made from thickets indicate that good seed years occur from four to seven years apart.

The yellow pine seeds annually, but the best seed years occur every three to five years. The seedlings are usually found in openings or down slopes and ravines where the wind may have blown the seed. They are found on all soils, but appear to prefer a well-drained, fresh soil. The seed does not carry far in dense stands, but in open forests it is scattered about 500 feet in the direction of the prevailing wind.

PLATE IV. A menace to reproduction.

Débris such as this constitutes a grave fire menace. A fire on this area would extend to live timber before it could be extinguished. The few remaining trees would be destroyed and the area would become a permanent waste. Several hundred thousand acres in this State are in a dangerous condition because the slash has been left as shown in this picture. The Government requires all slash on the National Forests to be piled and burned.

Douglas fir is nearly as prolific a seeder as yellow pine. Considerable seed is produced locally each year, and good seed years occur every three or four years. A fairly moist soil, free from duff, appears to be best for germination.

White fir is also a good seeder. Some seed is produced each year, but good seed years occur at intervals of two or three years. The character of the seed bed appears to be of little importance and the seed will germinate under almost any condition. However, some soil moisture is apparently desirable.

Partial shade is favorable to the early seedling stage of the incense cedar. Reproduction is good, both under old trees and in the open places. It is a prolific seeder, and all trees, no matter of what quality, appear to produce seed. Some seed is borne locally each year and good seed years occur every two or three years.

Rate of Growth.

Determining the rate of growth of our forest trees is a matter of great importance and one that cannot be overestimated. It is this factor, more than any other, that finally determines to what extent forestry can be made a profitable business proposition for the private owner. It must be remembered that the lumbermen have no investment in the actual growing of the present stand of timber now owned and being cut by them. To accurately determine the rate of growth a very large number of trees of each species must be measured. The diameters inside and outside the bark must be taken, the height measured and the age of the tree determined by ring counts. From these figures curves can be made that will show the average rate of growth for each species. It is obvious that the accuracy of these curves would depend upon the number of trees measured.

Owing to the lack of funds it was impossible to obtain sufficient data to construct any accurate curves, but a number of trees were measured in different localities to serve as an indication of the rate of growth of the present stands. It must be borne in mind that as trees of relatively small diameters only were taken, they were to some extent suppressed by the larger trees and their growth was much slower than it would be in cut-over land where the trees would receive full light. But the results obtained are sufficient to prove clearly that at least two things are necessary to make the growing of a second crop of timber an attractive business proposition.

First—The present method of taxation must be changed in such a way that the private owner can afford to hold the cut-over land for a term of years without financial returns.

Second—The reproduction on the cut-over lands must be effectively protected from fire in order to produce a future crop that will pay returns to the investor.

WEED LUMBER COMPANY.

The Weed Lumber Company owns 71,460 acres of forest land in Siskiyou County. Of this, 20,000 acres have already been cut over. The mills and factories are located at Weed, and the logs are hauled in from the camps by the California and Northeastern branch of the Southern Pacific Railroad. These camps are located from 25 to 45 miles northeast of Weed.

The elevation of the holdings ranges from 3,500 feet at Weed to 6,000 feet in the vicinity of Camp 1. For the most part the slopes are very gentle, and at the three main camps the logging is done with Michigan wheels. Camp 4 is the only camp where the land is being logged with donkeys. It is located on a small creek and the slopes are steep. The area logged with donkeys is relatively small, as only about 700,000 feet is cut per month, while the total cut from the four camps averages about 10,000,000 feet per month.

Type.

The pure yellow pine type prevails throughout the holdings. Incense cedar (*Libocedrus decurrens*) is found to a small extent in association with the yellow pine. Along the streams and on the flats near the streams Douglas fir (*Pseudotsuga taxifolia*) and white fir (*Abies concolor*) enter into the type in association with the yellow pine.

The stand as a whole is open and park-like, and the trees are short, with considerable taper, and do not clear themselves well. The stand will average from about 15,000 to 20,000 board feet per acre.

Fire.

No serious fires have occurred in this locality in recent years. A few small fires have been set by the donkey engines, but they have been extinguished before any damage was done. In earlier times practically the entire area was swept by two serious fires, one of which occurred thirty-eight or forty years ago and the other from sixty to sixty-two years ago. Nearly all of the mature trees are more or less scarred at the base as a result of these fires, and in many cases the fire scar is so deep that the lower section of the tree cannot be used. Many trees were entirely killed.

There are several reasons why there have been no bad fires of recent years. One is the open character of the timber, which makes fire easy to control. Another is that the company has adopted the policy of piling and burning its slash, this greatly reducing the fire danger. Unburned slash left scattered over the ground constitutes a very grave fire menace to the remaining trees and to the nearby uncut areas, but the danger of fire on cut-over land is reduced to a negligible quantity where the slash has been carefully piled and burned.

Still another reason for the absence of serious fires is the fact that the company is very careful. All fires are extinguished as soon as discovered, irrespective of their size or whether they appear dangerous.

A fairly good system of protection against fire has been adopted. The logging engines burn oil and the donkey engines are equipped with spark arresters. In addition to these spark arresters, an assortment of shovels and axes are always kept near the donkeys, and if by some accident a fire is set, it is promptly extinguished. The superintendent of the woods and the steward of the camps are constantly riding between camps and report any fires they may discover. The company's cruisers may also be classed as fire guards, because their work carries them throughout the entire holdings. The superintendent of the woods and one of the cruisers are state firewardens, having authority to call out the men at any time to fight fire.

A very complete system of fire protection has been established by the company for its mills and factories at Weed. The roofs of the buildings are equipped with sprinklers, and the interiors are equipped with the automatic sprinkling system. Two wire screens act as spark arresters on the burner. Fire hydrants are stationed at intervals throughout the grounds and a complete system of alarms has been arranged. A watch tower, equipped with telephone and a searchlight, has also been built on a nearby hill in order to observe fires at night.

Although the protection system in the woods is fairly good, it should be made more complete. This could be done very easily with only a relatively small outlay. The slash should be more carefully and more completely burned. Two men whose duties should be purely patrol and extinguishing fires should be hired by the company during the dry season. Conscientious men could be secured for about $50 each per month and expenses. Since the company maintains a store and keeps a great number of horses, their food could be secured at wholesale prices, and horses could be kept very cheaply. The total cost to the company should not exceed $160 per month. The dangerous season in this locality covers only from three to four months, making the total cost per annum not more than $640, or approximately nine tenths of 1 cent per acre. With such a system the company would be insured against a repetition of the fire which occurred about forty years ago, completely destroying hundreds of thousands of feet of timber and killing countless numbers of young trees, which to-day would have been ready for the market.

Forest Cover.

The forest cover found on the holdings of this company comprise the following species:

Manzanita, buckthorn, sagebrush, mountain mahogany, willow, deer brush, gooseberry, wild rose, Oregon grape, alder, aspen, and squaw-carpet.

Buckthorn was found only in the old cut-over land near Weed. Manzanita was found scattered over most of the area, but only in a few places did it make a dense growth. Except in the few areas where the chaparral growth was exceptionally dense, reproduction was not retarded to any marked extent. Sagebrush was found only in the extremely dry situations. Willow, aspen, and cottonwood were found in dense thickets along the banks of Antelope and Butte creeks. The wild rose and gooseberry were also found in the moister situations. Mountain mahogany was found more frequently on the dry slopes and benches.

Ground Cover.

The ground cover is fairly good in both the virgin and the uncut areas. In the virgin stand it consists mostly of a layer of needles and squaw-carpet varying from one to four inches in thickness. It is decomposing well, especially in the moister situations, making a very good seed bed. The ground cover was found to be best in the moist flats along the streams.

In the cut-over land, except in that portion which has been logged with donkeys, there is sufficient ground cover to make a good seed bed.

Logging.

Yellow pine forms almost the entire cut made by the company. This is not due to discrimination against other species, but to the fact that yellow pine occurs in pure or nearly pure stands in this locality. Douglas fir, incense cedar and white fir are cut when good trees are found, but they make up only a small per cent of the total cut.

An approximate minimum diameter limit of about twelve inches has been established by this company for all species. Some parts of the area have been cut over a second time for ties, and trees have been taken to a minimum diameter of about 8 inches. On an average from three to five trees of 12 inches or over in diameter have been left to the acre on the cut-over area. Many of the trees are poorly formed, but on the whole little damage was sustained by them when the area was logged. A great deal of damage, however, was done to trees under four inches in diameter. Very little attention was paid to the reproduction in felling and many trees were felled in and skidded over thick clumps of young seedlings, destroying a large percentage of them.

With a little care, the method of logging pursued by this company should do little or no damage to the trees left standing. The trees are felled by a crew of two men. After being bucked into logs, they are bunched in groups of from one to six logs, depending on their size. These bunches are hauled over skid roads to the landing by Michigan wheels. At the landing they are loaded onto the cars by a steam loader, and from here they are hauled to the main line of the California and Northeastern railroad by the logging engine.

The next crop on the cut-over area will undoubtedly be chiefly yellow pine, notwithstanding the fact that too few seed trees have been left. This is due to the fact that the virgin stand was composed of nearly pure yellow pine, and it is the only species near enough to re-seed the area.

The company should pay more attention to the reproduction when felling the trees and skidding the logs. A little care along this line would incur no expense and would leave the area in good shape to produce a second crop which in time would equal the virgin stand. More seed trees should also be left to re-seed the areas where there is no reproduction at present.

Waste in Logging.

The company is pursuing a policy of close utilization and comparatively little is being wasted. The tops are being taken to a small diameter and used in the company's box factory.

In general, the chief waste is in the high stumps and in the broken tops. The average height of the stumps in the recent cuttings made by this company is about 2.7 feet. There is no reason why this should not be reduced to a height of one foot. It has been demonstrated on government sales that this is entirely practicable and that the sawyers soon become accustomed to sawing in the new position. At first glance this waste may seem insignificant, but it may be easily demonstrated that it soon runs into the thousands of board feet.

The accompanying table represents a total of one acre of the recent cuttings on this tract. Thirty-one trees were cut from this acre. If the stumps had been cut to a height of twelve inches, the volume saved on this one acre would have been as follows:

TABLE NO. 1.

Stump.	Diameter at top in inches.	Total height in feet.	Height above one foot.	Volume saved cubic feet.
1	29	2.5	1.5	6.9
2	16	2.3	1.3	1.8

31	28	2.6	1.6	6.8
Total volume saved (cubic feet)				248.6

Thus 248.6 cubic feet or approximately 1,492 board feet would have been saved on one acre by cutting to this lower height. On one section, which represents about one month's cut by this company, the total unnecessary waste from high stumps was 640 times 1,492 board feet, or 954,880 board feet.

The broken tops were caused largely by carelessness in felling and much of this waste could easily be remedied.

That the waste in logging may be shown more clearly, sample plots of one fourth acre were chosen on areas representative of average conditions. The diameter and height of each stump were measured and tabulated by species. Unused tops were calipered at the butt, and their total lengths were measured in addition to the possible merchantable length to a point six inches in diameter.

The following table shows the result of such measurements for each plot:

WASTE IN LOGGING.

TABLE No. 2.

Plot No. 1. ¼ acre. (Camp 2.)

Stumps.			Unused tops.		Unused merchantable section.		Trees 6 inches and over in diameter left standing.		Condition.
Species.	Diameter outside bark (inches).	Height (feet).	Total length of top (feet).	Diameter outside bark at butt end (inches).	Length to 6 inch diameter (feet).	Diameter outside bark at butt end (inches).	Species.	Diameter breast high (inches).	
Yellow pine	29	2.5	26.0	14	Top forked and crooked.		Yellow pine	13	Alive and healthy.
Yellow pine	16	2.3	15.0	9	8	9			
Yellow pine	26	2.5	25.5	13	6	13			
Yellow pine	31	2.8	42.6	23	Top very punky at heart—spike top.				
Yellow pine	29	2.6	24.6	13	Top crooked—no value.				
Yellow pine	26	2.6	19.0	13	6	13			
Yellow pine	28	2.7	20.0	9	Top crooked and forked.				

Plot No. 2. ¼ acre. (Camp 3.)

Stumps.			Unused tops.		Unused merchantable section.		Trees 6 inches and over in diameter left standing.		Condition.
Species.	Diameter outside bark (inches).	Height (feet).	Total length of top (feet).	Diameter outside bark at butt end (inches).	Length to 6 inch diameter (feet).	Diameter outside bark at butt end (inches).	Species.	Diameter breast high (inches).	
Yellow pine	31	2.7	20.0	14	Top crooked—no value.		Yellow pine	11	Alive and healthy.
Yellow pine	24	2.7	26.0	14	4	14	Yellow pine	17	Alive; forked; no value.
Yellow pine	30	3.0	19.5	16	Top crooked and broken.				
Yellow pine	32	2.7	27.5	14	Top crooked and broken.				
Yellow pine	37	3.0	31.0	17	Top smashed.				
Yellow pine	23	2.7	Broken.	11	Beyond measuring.				
Yellow pine	26	2.9	Top smashed; impossible to measure.						
Yellow pine	34	3.0	36.0	12	Top broken.				
Yellow pine	31	2.8	21.5	11	Top too small and limby.				
Yellow pine	34	2.9	24.0	10	Of no value.				

Plot No. 3. ¼ acre. (Camp 3.)

Yellow pine	22	2.9	20.0	14	Top smashed.		Yellow pine	16	Alive; scraggy top.
Yellow pine	22	3.0	17.0	13	12	13	Yellow pine	16	Alive; scraggy top.
Yellow pine	20	2.9	Top burned; impossible to measure.				Yellow pine	11	Alive; not healthy.
Yellow pine	24	2.8	28.0	8	Top too small to measure		Yellow pine	12	Alive; fair condition.
Yellow pine	23	3.1	26.0	12	*6	12	Yellow pine	14	Alive; fair condition.
Yellow pine	19	3.1	25.0	13	6	13	Yellow pine	11	Dead.
Yellow pine	19	2.9	25.3	10	12	10	Yellow pine	6	Dead.
Yellow pine	26	3.0	18.0	8	Top crooked—no value.		Yellow pine	7	Alive; suppressed.
							Yellow pine	4	Dead.
							Yellow pine	13	Alive; healthy.

*Spike top.

Plot No. 4. ¼ acre. (Camp 4.)

Yellow pine	36	3.1	39.0	13	Broken by felling.		Yellow pine	14	Alive, healthy, but bruised by cable.
Yellow pine	30	3.0	33.0	14	Broken.*		Yellow pine	14	A stub, broken off by logging.
Yellow pine	29	2.7	Top badly broken—impossible to measure.						
Yellow pine	41	2.6	29.2	11	Too small.				
Yellow pine	35	3.0	36.0	18	Limby; 12-ft. log could have been taken.				
Yellow pine	28	2.6	38.0	13	Broken by felling.				

*Broken 2 feet above last cut; rest of top too small.

Disposal of Slash.

No disposal was made of slashings on the old cut-over lands. Tops were left on the ground with branches unlopped, forming a constant invitation to destructive fires. Fortunately, no bad fires broke out, and the slash is now in an advanced stage of decomposition and may not be considered a serious menace.

In recent years the company has adopted the policy of piling and burning their slash every fall. The disposal is not complete as the branches are not lopped and the débris is only partially piled, but the fire danger is greatly lessened. No attention is paid to reproduction when piling and a vast amount of damage is done. Sometimes the slash is piled in the open; sometimes up against such trees as are left, and often times in thick clumps of reproduction which are entirely destroyed when the piles are burned. Such damage is unnecessary and should be avoided. Slash should be piled away from reproduction and burned clean.

Insects.

Trees in this locality have not been greatly damaged by insects. A few young yellow pine were found to be infected with a specie of scale but none were found on mature trees. The scale was nowhere found in great numbers and the damage was not noticeable. The pine beetle was also noticed in this locality.

Second Growth.

The species comprising the second growth are yellow pine, incense cedar, Douglas fir, and white fir. Yellow pine occurs in nearly pure stands in the dry situations. Incense cedar enters into these stands to some extent. Douglas fir and white fir occur in association with yellow pine near streams and wherever there is considerable soil moisture.

As a whole, the ground cover is very fair. A good layer of humus has been formed by pine needles and herbaceous plants on all but the driest situations. Moisture conditions are poor in most of the tract, but there appears to be enough soil moisture present to support a fair stand of yellow pine.

Considerable chaparral has come up in the old cuttings, but the growth is seldom dense. It has served more as an usher growth and has not greatly retarded reproduction. In some localities, where no seed trees have been left, chaparral has taken complete possession. It will be necessary to seed these areas to produce a second crop that will pay to cut.

In general, the reproduction is as good as could be expected under a clear cutting system, and the indications are that if fire is kept out, a scattered stand of nearly pure yellow pine will mature.

Recently Cut-over Land.

Reproduction on recently cut-over land is not nearly what it should be to produce a normal stand. Too few seed trees have been left to reseed the barren areas. Young growth in the virgin stand occurs mostly in patches, but would produce a fair second crop if sufficient care was used in logging to save it.

But, under present conditions, most of this growth is destroyed. Trees are felled in and logs are skidded over dense clumps of young yellow pine. This damage is greatest in areas logged with donkey engines. By far the greatest per cent of damage to reproduction, however, is done in careless piling and burning of slash. At least 75 per cent of all young growth in the virgin stand is destroyed during logging operations. The remainder is not enough to produce as good a future stand as the soil is capable of yielding.

Reproduction.

So far, no attempt has been made to replant natural openings occurring in the woods. In many places this practice is essential that a fully stocked stand may be secured. Excessive light admitted to such areas after logging is unfavorable to natural reproduction. Chaparral species occur in varying numbers and their growth is greatly accelerated after logging because of additional light. A proper control of the amount of light admitted to any area is more important than any other factor in regulating the number and kind of species destined to predominate in the future crop.

Too close logging may not only afford the cut-over area or germination bed too much light for the natural propagation of trees, best suited for commercial purposes, but may remove all of the seed-bearing trees and thereby prevent natural re-stocking until the smaller trees bear fruit.

On the whole, the area under consideration is re-stocking quite well. Some planting or seeding will be necessary on frequent openings remote from seed trees. Since most of the seed-bearing trees are removed, intensive patrol is of the utmost importance during the dry, hot summer months, for areas burned over after logging can no longer be restocked by natural seeding.

To show more clearly the result of lumbering, sample plots one-quarter acre each were laid out on representative cut-over areas. The height and diameter of each stump were measured. These measurements give a clear picture of the number, size, and kinds of trees removed. All remaining trees over one inch in diameter were calipered and recorded by species and diameter classes; and those under one foot in height and one to six feet in height were measured and classified.

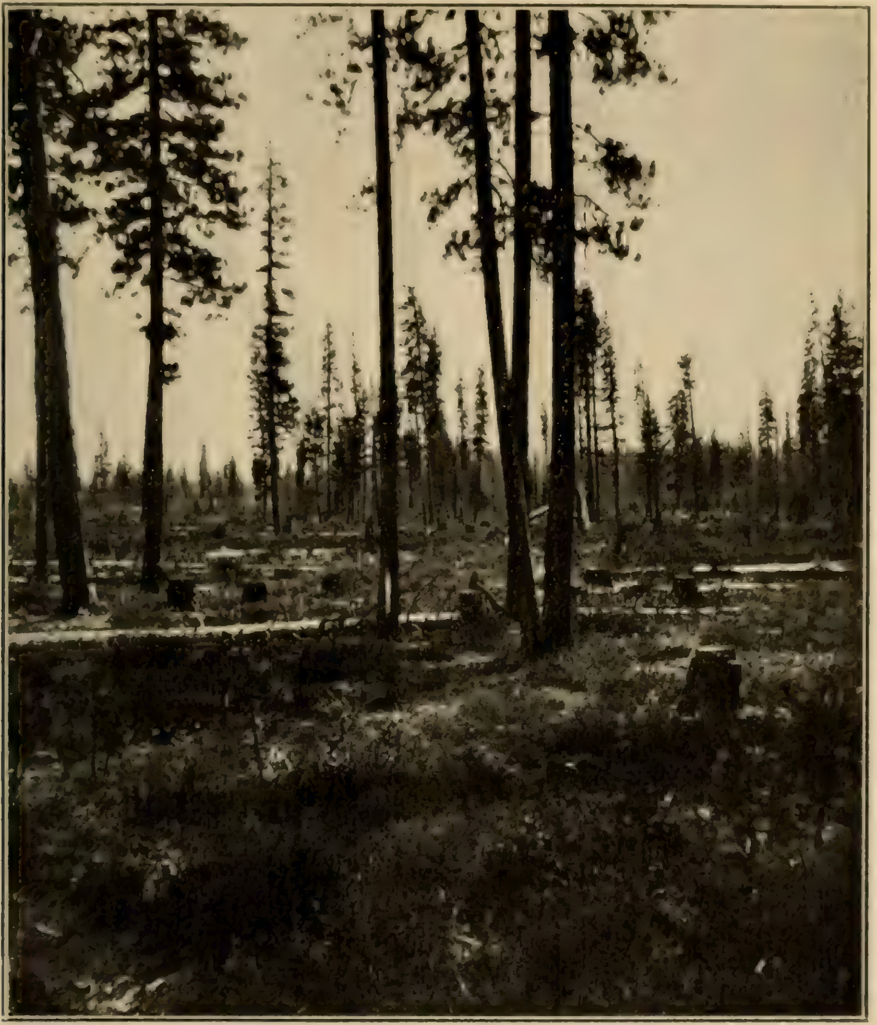

PLATE V. Proper disposal of slash.

The slash on this area has been piled and burned, and the land is now in good condition to produce another crop of trees. The fire danger to reproduction is reduced to a minimum. A surface fire, should one occur, could easily be extinguished. Disposal of slash is an important procedure in the protection of cut-over lands.

The following table gives the result of the measurements taken in tabular form. Special attention is directed to the lack of trees of sufficient size to produce seed:

TABLE No. 3.

REPRODUCTION ON RECENTLY CUT-OVER LAND.

Plot No. 1. (Camp 4.)

Stumps.			Species over 1 inch in diameter.					Seedlings.						Remarks.
								1 to 6 feet in height.				Under 1 ft. high.

Yellow pine	2.6	37	17		1								
Yellow pine	2.4	29											

Rate of Growth.

A thorough study of the rate of growth was not made. It is apparent from the measurements taken that yellow pine makes a good diameter growth during the first thirty or forty years. After that, the growth is slower. Thirty-five yellow pines of average growth were measured. They varied in diameter from 13.5 inches to 25.6 inches. The total height ranged from 55.6 feet to 103.5 feet and the age from 100 years to 207 years.

Conclusions.

The Weed Lumber Company is not practicing conservative forestry. No working plan for forest management has been prepared, and the annual cut is made without reference to the increment. The annual increment has not been ascertained nor has a financial rotation been established.

Logging is conducted without reference to the future or to the effect it has upon reproduction now on the area. Practically every tree of merchantable size on the logging area is felled and utilized. Comparatively speaking, close utilization is practiced. Stumps could be cut lower to advantage, and the bole, oftentimes, could be utilized to a smaller diameter in the top. Too few seed trees are left. Years must elapse before the areas first logged will have produced sufficient timber to afford a profitable second crop.

Slash on the older cuttings was not burned. In recent years, however, the tops and lops are burned every fall or spring. This practice lessens the fire risk, encourages the use of logged-off areas for grazing, and results generally in better forest conditions. More care should be exercised in piling brush to secure a cleaner burn and to protect reproduction, much of which is now unnecessarily destroyed during the burning operations. Brush piles should be made away from standing trees, and, so far as is practicable, placed in open places.

Areas that have little reproduction, after having been closely logged, should be planted or seeded before chaparral becomes firmly established. It can be held in check and eventually crowded out by the shade produced by young plants. On the whole, natural reproduction is good.

Every precaution is taken against the escape of fire in the woods, and prompt action is taken to extinguish those that do start. The woods superintendent, cruisers, and commissary clerk cover the territory between camps so frequently that they serve as patrolmen. Areas that are being logged are therefore well protected. Cut-over land, remote from the traveled trails and roads between camps, are unprotected and a fire once started could easily gain dangerous headway before the crews could be assembled and transported to the danger zone. For this reason two patrolmen should be employed during the fire season with no other duties. They should report in, daily, from designated stations, which should be connected by telephone with one of the camps.

McCLOUD RIVER LUMBER COMPANY.

In General.

The holdings of the McCloud River Lumber Company are situated northeast of the town of McCloud. The area comprises 232,063 acres, of which about 71,000 acres are cut-over and 161,063 acres are virgin. The country is rough and mountainous in a large part of the tract, but opens out into rolling ridges and flats where logging conditions are almost ideal.

Fire.

Serious fires occurred on this area approximately fourteen, thirty-seven and forty-five years ago, as evidenced by ring counts on the fire-scarred stumps. These fires burned over large areas between McCloud and the present camps on which chaparral has now taken possession.

There have been no bad fires in recent years for the reason that the company has adopted a fairly efficient system of fire protection. All logging engines are equipped with spark arresters. Two firewardens with salaries of $75.00 per month and horse feed, are hired. Their duties consist of patrol work during the fire season and taking charge of the brush burning in the spring and fall. They report each week to the superintendent of the company and have orders to call out a whole camp if necessary to extinguish a forest fire. All campers and hunters on the company's holdings must obtain a permit from the office, and each firewarden must report the campers when they arrive in his territory. The company has had seven of its employees appointed state firewardens.

At the donkey camp, two night watchmen are employed to watch for fire. One patrols the camp and the other watches the donkeys. If fire is discovered, the watchman reports to the camp foreman immediately and the crew is at once called out to extinguish it. All employees, including the railroad crews, have orders to stop work and extinguish fires. The section crews are required to keep the old rotted ties and rubbish along the right of way burned up. Water barrels have been placed at intervals on all trestles. The company's warehouses at Bartol have water barrels on the roofs and a fire hydrant with a real fire hose is located near them. At the mill and around the company's administrative buildings in McCloud are located hydrants with reels of fire hose placed conveniently close together. The interior of the buildings have been equipped with automatic sprinkling systems.

Forest Cover.

Dense stands of chaparral have taken possession of most of the old cut-over lands. Even where recent fires have burned off the forest cover, the chaparral is rapidly sprouting and will undoubtedly again take possession of most of the area. On the areas of the oldest fires, most of the seedlings have outstripped the forest cover and will eventually regain possession. The species forming the forest cover on the old cut-over lands are manzanita, buckthorn, ceanothus, black oak, willow and cherry. Additional species, such as dogwood, aspen, alder and wild rose, are found on the recently cut-over lands, where enough white fir has been left to produce a partial shade. These latter species also occur as an undergrowth throughout the virgin stand. The manzanita, ceanothus, buckthorn, wild rose and black oak grow on the drier locations while the willow, dogwood, alder, and cherry seek the more moist situations.

Ground Cover.

The ground cover on the old cut-over lands is very thin, consisting of squaw-carpet, thimbleberry, ferns and a thin layer of pine needles and chaparral leaves. Ferns and thimbleberries are found only where the moisture conditions are good. On the more recently cut-over lands, grasses, ferns, thimbleberries and other herbaceous plants grow in abundance, and a thick layer of duff, humus, needles and leaves is found everywhere except on small burned areas. The ground cover is decomposing most rapidly in the moderately moist situations and is making a good germinating bed for seeds.

Logging.

Very little damage is done to the reproduction by the logging operations. A diameter limit of 18 inches on the stump has been established for all species. This limit is sufficient in this locality to leave plenty of seed trees to restock the cut-over areas. Fine, thrifty yellow and sugar pines up to 18 inches in diameter were noted on the recently cut-over lands. Only sugar and yellow pine are being cut for the market. Fir is taken only for a specified order or when it has to be cut on the right of ways or for the company's own construction use or for fuel.

Stands that run heavy with firs, even though there are scattering pines in mixture, are left with the hopes that a future market can be found so that all the mature timber of all species can be cut to advantage. Some of the most accessible pine is taken from these stands, but the remaining areas appear almost virgin.

Trees are used down to a top diameter of 8 inches to 12 inches according to the character of the top. Stumps are cut to an average height of 2.8 feet. Timber, broken in felling, is used in odd lengths down to a minimum of 8 feet. If the company continues to discriminate against white fir, it will undoubtedly be the predominating specie in the next stand because of the numerous mature seed trees left, with their prolific seed-bearing power and the high percentage of germination of the seeds. More fir should be cut in order to check its rapid re-seeding of areas suitable for the reproduction of the more valuable pines.

Waste in Logging.

This company is pursuing the policy of fairly close utilization of its timber. All trees smashed in felling are taken down to a length of 8 feet. The stumps average 2.8 feet in height. In only a few instances have tops been left that might have been utilized had they been taken at the time of logging. The reason for the small waste is that the company owns a well equipped box factory at McCloud and the odd lengths can be profitably utilized. Instances were noted where doty and wind shaken logs, containing barely enough lumber to pay for the cutting and handling, were taken.

Disposal of Slash.

Slash is partially piled either in windrows or piles during the logging operations. Soon after the first rains in the fall and before the last rains in the spring, the two company firewardens take charge of the brush-burning crews. The slash, as it is lopped, is thrown out of the way of the skidders, sometimes on young reproduction, sometimes on top of the chaparral and sometimes in the open. The brush burning is not thoroughly done for the reason that the tops are not lopped enough to aid the fire in consuming the larger branches. However, the needles and small branches are consumed and the greater part of the fire danger removed. The slash should be piled away from the reproduction, for a large per cent of the growth is destroyed by the present system.

In the old cuttings, which have not been burned over, the slash has dropped its leaves and is slowly decomposing. It does not constitute a serious menace, but would make ready fuel in case of a ground fire.

PLATE VI. Destruction by fire.

Results of a ground fire in Shasta County that burned over four sections of cut-over land and destroyed a portable sawmill, the ruins of which are shown in the picture. All tree growth in the path of the fire was destroyed. Chaparral is already taking possession of the area. Sparks from a donkey engine started this fire. Had there been an efficient system of fire protection, the fire would never have reached the mill.

Diseases.

Fungi is working in the heartwood of the sugar and yellow pines and doing considerable damage. A grayish white growth forming in the tops of the sugar pines indicate that it is sapping its nourishment from the host and slowly destroying the heartwood. A growth of 6 inches in diameter and 15 inches in length will destroy from 6 to 8 feet of the trunk. Heart-rot runs badly in sugar pine when punky holes, left by drying branches, are found on the exterior. Considerable heart-rot is also found in yellow pine, but they run more sound than the sugar pine. The incense cedar runs very doty with dry rot, especially when mature.

Rate of Growth.

A detailed study of the rate of growth of the several species was not made. Fifteen yellow pine trees were carefully measured to give an idea of the number of years required to attain their diameter and height growth. Diameter measurements were taken at a point 4.5 feet from the ground. These trees varied from 12 inches to 23.6 inches in diameter and are from 38 to 177 years old. Their total height ranges from 50.8 feet to 167.4 feet.

Conclusions.

The McCloud River Lumber Company is not practicing conservative forestry because the annual cut is made without reference to the yield. No rotation of crops has been established. Future yield is being left to chance.

An approximate diameter limit of 18 inches has been established for such species as are harvested. This practice offers some assurance for natural reproduction but will not secure a fully stocked stand on cut-over areas. But little white fir is being removed, so this species will form a larger percentage in the next crop and to the exclusion of the more profitable ones. Close utilization of felled timber prevails.

A fairly good fire protective system is in force. Mounted patrolmen ride continually during the dry season; woods foremen and train crews are instructed to respond promptly to fire calls; and a hunting and camping permit system is in force.

Tops and lops resulting from logging are burned under favorable conditions. Not enough attention is given to reproduction during the burning operations. Brush piles should be made as far from seedlings as possible. Tops should be lopped closer to insure a cleaner burn.

CASTLE CREEK WATERSHED.

In General.

Castle Creek empties into the Sacramento River in section 22, township 38 north, range 4 west, about one half mile north of Castella, Shasta County, About 30,000 acres, which are located in township 38 north, range 4 west, township 39 north, range 4 west, township 38 north, range 5 west, and township 39 north, range 4 west, about one half mile north of Castella, Shasta County. ranges from 2,000 feet at the junction of the stream with the Sacramento River to about 4,000 feet at its source. The slopes, varying from gentle to very steep, come down almost to the bed of the creek, but near the mouth, the canyon widens out until it is nearly a fourth of a mile in width.

Fire.

Old fires have swept over this watershed, completely killing large areas of timber and doing great damage to many other areas where the trees were not entirely killed. Chaparral has taken complete possession of many of these burned over slopes. Almost every mature tree on this watershed is more or less scarred and charred stubs are scattered throughout the entire area. It is impossible to determine the exact dates of these fires, but the indications are that there were at least three, which occurred at intervals of approximately fifty years.

There have been no bad fires on this watershed during the last ten or twelve years. This is due to the fact that a part of the basin has been included in the Shasta National Forest and in consequence the entire area has been protected.

Aside from the Government patrol, very little is being done on this watershed in the way of protection. The M. A. Burns Lumber Company is operating in this basin, but they are doing little or nothing to protect their timber. Their engines are not equipped with spark arresters, no patrol has been instituted on their lands, and their slash, which is unburned, is a serious menace.

They do not coöperate with the Government, except in so far as is specified in their contracts purchasing government timber, but they are endeavoring to be reasonably careful about starting fires and put out any fire they may discover on their own land.

The company should be required to equip all of their engines with spark arresters, and to burn their slash each year. Under the present conditions it would be almost impossible to extinguish a fire in the cut-over lands. It would not be necessary for them to institute any system of patrol for the area owned by them is comparatively small, and the government rangers patrol the entire watershed. They could easily notify the company in case a fire breaks out on their own land.

Reproduction.

In the areas where there have been no recent fires, the reproduction is fairly good in both the virgin and the cut-over lands and consists mainly of yellow pine, Douglas fir and incense cedar. Sufficient seed trees to produce a future crop have been left in the cut-over land belonging to the government and the reproduction is fairly good. The privately owned cut-over land has been logged too close. Insufficient seed trees have been left, and chaparral is gaining possession of the logged-off area. However, if fires are prevented a light unmerchantable stand can be secured. The danger of fire to the young growth on the private land is much greater than to that on the government land, because of the slash which has been left unlopped and unburned on the ground. There is little or no reproduction on the burned-over areas. No seed trees were left alive to re-seed the ground and the present chaparral growth is very dense. It would be necessary to seed these areas artificially to produce a future stand of timber.

Forest Cover.

The chaparral species noted on this watershed were willow, alder, cañon live oak, California oak, maple, manzanita, buckthorn, flowering dogwood, California redbud, chinquapin, rose, lilac, thimbleberry, Oregon grape, and squaw-carpet.

Dense thickets of willow and alder grow along the banks of the creek. The oaks and maples were found on a variety of soils, ranging from moist to very dry, but were noted in greatest abundance below 2,500 feet in elevation. The manzanita and buckthorn were found on the dry slopes and in dense growth throughout the old burns. There is considerable forest cover throughout the entire watershed, but it does not appear to retard reproduction on the cut-over land where sufficient seed trees have been left. In some parts of the virgin stand the forest cover is dense enough to hinder reproduction, but these areas are small. There is little or no reproduction in the dense thickets of manzanita and buckthorn found on the steeper slopes. However, these chaparral areas act as a substitute for the trees in conserving the moisture and preventing erosion on the watershed.

Logging.

Approximately 3,000 acres have been cut-over on this watershed. Of this, about 1,500 acres were on government land and the remainder on privately owned land. The logs were hauled down dry chutes to the logging railroad with donkey engines.

Cut-over land belonging to the government presents a great contrast to the privately owned land. On the former, the effect of logging has been merely to thin out the stand and make way for a good future crop. A diameter limit of approximately eighteen inches was established, and a sufficient number of thrifty seed trees of the most desirable species were left to produce another crop of timber. On the privately owned land, however, the area has been completely skinned. Everything from which a log could be secured, was cut, and there are far too few seed trees left to re-seed the area. A large per cent of the privately cut-over land is already in possession of chaparral and would undoubtedly need artificial seeding to produce a future stand of timber that would pay to cut.

Waste in Logging.

A policy of very close utilization has been followed on all the government land. The stumps were cut down to a height of from 1.5 to 2 feet and the tops were taken up to a very small diameter. On the private land, the unnecessary waste has been great. The stumps were found to range from 3 to 5 feet in height and long unused tops were left, from which another log could easily have been taken. Many trees also were broken by careless felling and a number of logs of merchantable diameters were left in the woods.

Disposal of Slash.

All the slash has been burned on the cut-over land owned by the government. The branches were lopped from the tops and the slash was piled away from the young growth so that very little damage was done to it when the piles were burned in the fall. The contrast between the condition of the slash on the government land and that on the privately owned land is so great that one can almost determine the exact boundaries between the two merely by looking at the slash. Nothing was done with it on the privately owned land. The tops were left on the ground with their branches unlopped and at the present time constitutes a grave fire menace to the reproduction. On the old cuttings, a part of it has been destroyed by fire and the remainder has decomposed to some extent. If fire is kept out for a few years more, the slash will probably decompose enough to greatly reduce the danger to the reproduction. But on the recent cuttings, the slash is so thick in many places that one cannot pass over the area without great difficulty.

PLATE VIII. Result of repeated fires.

A once thickly timbered area now covered with a dense growth of chaparral as a result of repeated fires. There are approximately 5,000,000 acres of chaparral land in California, which were once covered with timber. Repeated fires have killed the trees and given the chaparral possession. Burned timber pays no wages and turns away labor empty-handed. Taxes on other forms of real estate are increased. An adequate protective system, maintained by the State, would prevent these disastrous fires.

Conclusions.

The deep slopes of the Castle Creek watershed need protection to prevent erosion and to conserve the water.

The M. A. Burns Lumber Company which is operating on this watershed, should coöperate with the government in protecting their lands from fire. Their engines should be equipped with spark arresters. The company should establish a larger diameter limit in order to leave sufficient seed trees to produce a good future stand.

The slash on the private lands should be piled away from the young growth and burned every fall after the first rains in order to reduce the fire danger to the reproduction. Unnecessary loss resulting from high stumps, unused tops, careless felling and logs left in the woods, should be discontinued.

LA MOINE LUMBER AND TRADING COMPANY.

In General.

The holdings of the La Moine Lumber and Trading Company are situated about seven miles west of La Moine, Shasta County, around the headwaters of Slate Creek, which is tributary to the Sacramento River. The tract comprises about 13,630 acres, of which 8,106 acres are cut-over and 5,524 acres are virgin. The elevation ranges from about 1,000 feet above sea level at La Moine to approximately 4,500 feet near the Trinity divide. The slopes are very steep and all logging is done with donkey engines.

The logs are hauled from the woods to the mill by a narrow-gauge railroad. All lengths are taken, but the 32-foot logs are used as much as possible to facilitate handling with the donkeys. The sawed lumber is sent by flume from the mill to the yards and factory at La Moine.

Fire.

Bad fires occurred in this locality approximately seventy-two, fifty-seven, forty, and twenty-two years ago, as evidenced by ring counts on the scarred stumps. The bareness of the area, the numerous charred stubs and the extensive chaparral areas prove that devastating fires have swept the area. There have been no serious fires, however, in recent years, due to the more careful handling of donkey engines, and the inclusion of the adjacent land within the Shasta National Forest, which is patroled during the dangerous season.

The company has a fairly good system of protection around its improved properties. Hydrants with reels of hose are scattered conveniently about the grounds of the box factory at La Moine and the buildings are equipped with an automatic nozzle system. The land around the mill was cleared as a protective measure, and hydrants, under pressure, have been installed at the mill. The donkey engines in the woods are equipped with spark arresters.

The company maintains no system of patrol on its holdings, and if their timber is to be protected from future fires, it will be necessary to establish some sort of patrol. The lands are so situated that one man could patrol such part of the holdings as to obtain a general view of all the rest of the area. This guard also could take charge of burning the slash and thus decrease the danger of destroying the virgin timber. A competent man for this work could be secured for about $50.00 per month and board, making the total cost to the company not more than $75.00 per month. In this region the dangerous season covers only about four months and the total cost of this protection would not exceed $300 or approximately 2 cents per acre.

Forest Cover.

Chaparral makes a rather dense growth in the virgin stand. Where the timber is thin, the brush has taken possession almost to the exclusion of all other growth. On the cut-over land, the chaparral is coming in rather slowly, but the indications are that it will claim most of the area, as there are far too few seed trees to give the reproduction a fair chance to get started. On the dry situations the following species were noted: Buckthorn, manzanita, ceanothus, rose, sadler oak, black oak, chinquapin, wild plum, lilac, and cherry. The following additional species were found in the more moist situations: California buckeye, dwarf maple, broadleaf maple, Oregon oak, California laurel, snowball, pepperwood, wild raspberry, elderberry, California redbud, Oregon grape, willow and dogwood.

Ground Cover.

The ground cover in the virgin forest is good, consisting of duff, humus, needles, ferns, squaw-carpet, and numerous herbaceous plants. Owing to the abundance of forest cover in the virgin stand, the ground cover is kept fairly moist and is decomposing well, making a suitable bed for germination. On the cut-over lands, the ground cover is scarce. Many places were noticed where the mineral soil was exposed. Over this area, it would probably be necessary to resort to planting to prevent the area from being claimed by chaparral.

Rate of Growth.

The number of trees measured are insufficient to indicate accurately the rate of growth in table form, and the following data obtained by measuring twelve yellow pine, five white fir, two Douglas fir and three sugar pine, all of which were more or less suppressed, will serve only as an indication of the rate of growth on these holdings. Diameter measurements were taken at a point 4.5 feet from the ground.

Yellow pine attained diameters varying from 14.6 inches to 25.8 inches; ranged from 111 years to 177 years old, and in total height from 65.7 feet to 126.75 feet.

Sugar pine attained diameters varying from 16.6 inches to 18.2 inches; ranged from 152 years to 173 years old, and in total height from 74.9 feet to 88.5 feet.

White fir attained diameters varying from 15.8 inches to 19.7 inches; ranged from 100 years to 163 years old, and in total height from 73.4 to 97.7 feet.

Douglas fir atained diameters varying from 18 inches to 19.1 inches; ranged from 174 years to 217 years old, and in total height from 85.1 feet to 102.2 feet.

Logging.

The character of the ground on this area is such that only donkey logging is possible. This method necessitates a considerable amount of damage to the young growth, but this company is taking no care to avoid unnecessary injury. They are very careless in felling and skidding and many standing trees are smashed. Nearly all the seedlings are destroyed. An approximate diameter limit of fifteen inches on the stump has been established. Since there are few trees below this limit the system is one of clear cutting rather than of selection, and the cutting area thus becomes denuded. No attempt is made to protect reproduction.

The diameter limit must be increased to insure another crop. Natural restocking is practicable, so seed trees must be left. A large per cent of the damage to the young growth could be avoided with a little care, and the area would then be left in condition to produce a good future stand.

Waste in Logging.

Aside from the smashed tops, the unnecessary waste in logging is small. Odd lengths, down to eight feet are taken for the box factory and the tops are used down to a diameter of 10 to 12 inches. The stumps are cut low, averaging only about two feet in height.

The principal waste is in the smashed tops. Most of this is caused by carelessness in felling and could easily be avoided. At present, many of the trees are felled down hill and often slide 50 to 100 feet, breaking the top so that, at least, one log is wasted.

Disposal of Slash.

In the old cut-over land, the slash that has not been destroyed by accidental fires is decomposed and does not constitute a serious menace. No disposition is being made of recent slash. The tops are not lopped, and the débris is left scattered over the ground. On the recently cut-over land, this condition is a grave fire menace to the young growth. The menace is further increased bcause of the dense brush which adds greatly to the fury of a fire once started.

Conclusions.

This company does not apply correct forestry principles in the management of its timber lands. No rotation has been established; the annual cut is made without reference to the annual increment; logging is conducted without reference to the future; and no policy has been adopted for the protection, management and reforesting of its cut-over lands.

The diameter limit established removes practically all the merchantable timber and no seed trees are left to restock the logged-off areas.

So much timber has been removed that light conditions are unsuited to natural reproduction, and chaparral bids fair to take possession of the ground that once supported a profitable forest crop.

Unnecessary damage is done to trees left standing, and to seedlings and saplings which would otherwise mature and yield more timber in time to come.

Tops, lops and other refuse left after logging are not piled or burned. Slash left in this manner invites fire which, once started, is expensive to suppress and does untold damage to reproduction and to the watershed.

Land left in such a condition, when unsuited for agricultural purposes, is unproductive and increases the taxation on other forms of property. The assessed valuations, even on timber land, are far too low.

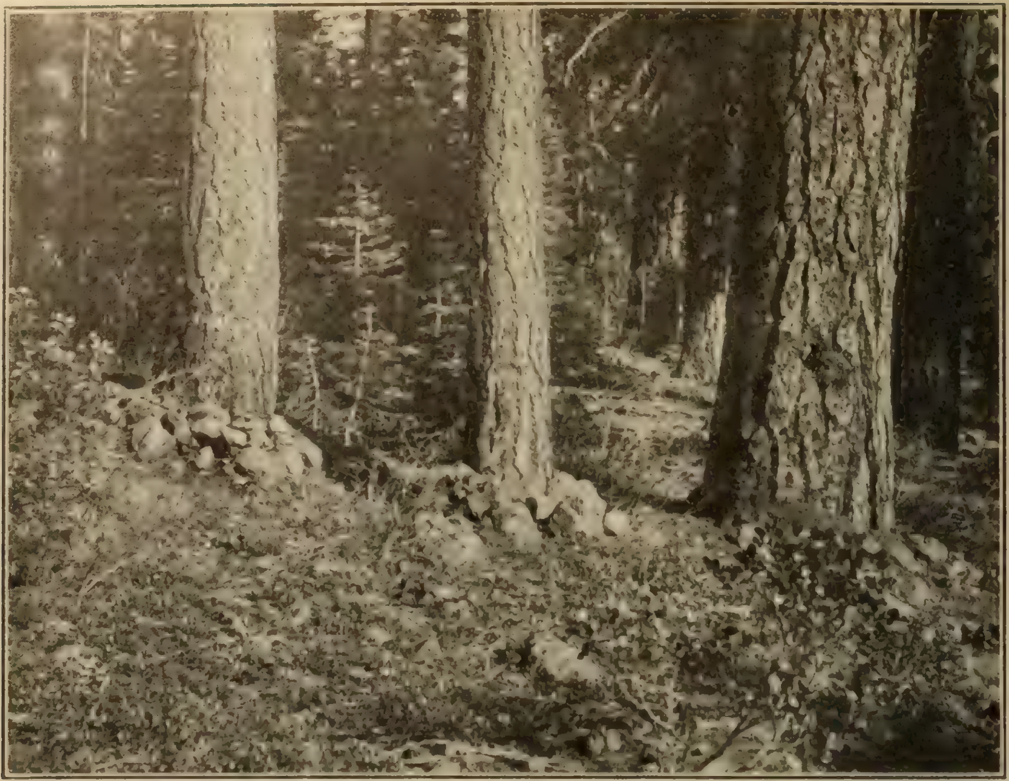

PLATE VIII. "Light Burning."

Some persons argue that forest fires can be prevented best by burning over forest areas periodically. The base of marketable trees are banked with dirt or rocks preparatory to burning. This practice is termed "light burning"—more properly "Piute Forestry." The forest floor, so necessary for the retention of water, is destroyed; seedlings and small trees are killed and the ground is unsuited for the germination of the seeds. The cost is prohibitive. It would cost about $9,000,000 to burn over our forested area once. Such a practice should be prohibited by law.

TERRY LUMBER COMPANY.

In General.

The Terry Lumber Company's holdings are situated about 35 miles northeast of Bella Vista, in the eastern half of Shasta County. They comprise 17,500 acres, of which 8,700 acres are virgin; 7,080 acres are cut-over and 1,720 acres are partly cut-over. The altitude of this tract varies from 2,800 to 5,500 feet above sea level. The mill is located at an elevation of about 4,200 feet. While logging was being carried on below this elevation a portable mill was operated and the rough lumber hauled to the flume by traction engines. The present logging camps are about four miles from the mill and the logs are hauled in by a narrow-guage railroad. The mill has a capacity of about 100,000 feet board measure daily, but during the season of 1911, cut only between 50,000 and 60,000 per day. From here, the rough lumber is flumed to the finishing mill at Bella Vista.

Fire.

The entire tract has, at some time, been burned over. Hardly a mature tree can be found that is not more or less scarred at the base. It was impossible to determine the exact dates of these fires, but it is evident that they occurred many years ago, for the fifty or sixty year old trees were not touched.

The only serious fire in recent years occurred in 1910. During this year numerous blazes were started by sparks from the logging engines. All but one was extinguished before any considerable damage was done. This fire was started by sparks from a donkey engine in section 2, township 34 north, range 1 east, and burned through sections 2, 11, 10 and 9 in the same township, completely destroying the portable mill in section 9. It was confined principally to the cut-over land, and, outside of destroying the mill, by far the largest amount of damage was done to the young growth. Everything in its path was killed and all the ground cover was destroyed, exposing the bare mineral soil in many places. Young growth is coming into this burned area very slowly, and as there are no seed trees left, it bids fair to eventually become covered with worthless chaparral.

Most of the cut-over land has been burned either at the time of logging or soon afterwards. Such fires are regarded by the company as being of little importance and no records are kept of them. That they were probably caused by indifference on the part of the company, in most cases, is shown by the absence of spark arresters on the engines and the fact that they occurred during or soon after the logging operations. Most of the young growth and such mature trees, as were left after logging, have been killed by these fires and a large part of the cut-over area is now in the possession of chaparral.

This company has no system of protection for its timber land. There are no spark arresters on any of the engines, and apparently little attention is paid to fires unless they threaten improved property. Some attempt has been made to protect the mill by means of hydrants about the grounds and barrels of water on the roof. The hoist at Camp No. 2 is also equipped with water barrels. If a fire is discovered at the start, this system of protection might be effective, but it would undoubtedly prove inadequate should the fire gain headway before being noticed.

Forest Cover.

The following species of chaparral were noted on this tract: Manzanita, buckthorn, wild lilac, deer brush, cascara, dwarf maple, alder, black oak, chinquapin, bitter cherry, western dogwood, gooseberry, wild rose, mountain willow, thimbleberry, redbud, Oregon grape, aspen and squaw-carpet.

Manzanita and buckthorn occurred mainly on the dry slopes and benches, and there was little or no reproduction on these areas. Lilac, deerbrush, cascara, maple, oak, chinquapin, gooseberry, rose, cherry, thimbleberry, redbud, and dogwood were found in a variety of soils, in situations ranging from moist to fairly dry. These species were not generally found in dense stands on this tract but were scattering and served as an usher growth for the seedlings. Alder, willow and aspen were found principally in the moist situations and along the streams.

Ground Cover.

The ground cover is good throughout most of the uncut area, consisting of a good layer of needles, a number of ferns, squaw-carpet, Oregon grape and thimbleberry. It is decomposing well making a good layer of humus. This is especially true of the more moist situations, where it makes a very suitable bed for germination.

On most of the cut-over land, especially that which has been cut in the last decade, fire has destroyed the ground cover, leaving a mineral soil exposed. Ferns and squaw-carpet are coming in the most rapidly on these areas, and there is also a thin layer of needles deposited by the dying trees.

Logging.

Because of the steep character of the country, the logging is done entirely with donkeys. The logs are hauled down dry chutes to the railroad. From here the loaded cars are drawn to the top of the ravine by means of a hoist and cable, and the logging engines take them from the hoist to the mill. The company is cutting entirely too close to provide for a second crop. Every tree from which a log can be secured is taken. Trees above 18 inches in diameter are cut for lumber; below 18 inches, they are cut mostly for ties. The stand remaining after logging is composed of scattered, unsound trees, with dead and dying tops.

No attention is paid to young growth when logging, and a large per cent of the seedlings are destroyed by careless felling of trees and skidding logs; but this damage is small compared with that done by the fire, which almost invariably follows logging on these holdings. All the remaining young growth is destroyed by this fire and the area left to become covered with chaparral.

If a second crop is to be secured on these lands, it will be necessary (1) to leave more seed trees, (2) to exercise more care in logging and (3) to protect the cut-over lands from fire.

Waste in Logging.

The chief wastes in logging noted were in high stumps and in broken tops. The stumps averaged about three feet in height, and could be cut to a height of 18 inches to two feet without additional expense.

Most of the broken tops were caused by carelessness in felling. Trees were often felled down the side of a steep hill and, as a result, the tops were badly smashed destroying, at least, one merchantable log.

Several sample plots were taken in different localities to show these conditions graphically. The following tables were made from the data secured on these plots:

WASTE IN LOGGING.

Plot No. 1.

¼-acre plots.

Stumps.			Unused tops.		Unused merchantable section.		Trees left, 6 inches in diameter and over.		Remarks.
Species.	Diameter outside bark. (inches).	Height. (feet).	Total length of top. (feet).	Diameter outside bark at butt. (inches).	Length to 6 inch top diameter, (feet).	Diameter outside bark at butt. (inches).	Species.	Diameter breast high. (inches).

*Heavy branches.

†Broken above 18 feet to 2-foot diameter.

Disposal of Slash.

No disposition is made of the slash. On the recently cut-over lands it constitutes a serious menace to the reproduction, and when fire comes in, as it most invariably has done on this tract, it will destroy all the young growth. If the branches were lopped from the tops and the débris piled and burned in the fall, ample protection would be afforded to reproduction since the ground cover is not thick enough to make a very hot fire.

Considering the area as a whole, the present fire menace from slash is not great, for the reason that most of the cut-over land was accidentally burned over at the time of logging or soon afterwards.

Second Growth.

On the area cut about 1892, before the present company assumed ownership, only the choicest and most accessible sugar and yellow pine was taken. This was due to the fact that the timber has to be freighted to Bella Vista, a distance of thirty miles, by teams, as the flume was not then built. So little has been taken out that the stand appears virgin to-day and a traction road is being built for the purpose of again logging it.

In examining the land cut over ten years ago (1902), a representative area of four acres was taken and only one small tree was found. Fire had swept the area and destroyed all the remaining young growth, and buckhorn, manzanita, deer-brush, and willow had taken possession. The soil and moisture conditions were good, but unless seeding or planting is resorted to, the area will remain in the possession of the chaparral. A few white and Douglas firs were noted in patches on this area, but they were far too few to reseed any great portion.

On the south half of section 1, township 34 north, range 1 east, the five-year old cut-over land was examined. They had cleared this area also. In only a few spots where fire had missed were any seedlings found. Sample areas taken in this cutting, would, in the majority of cases, show no reproduction. Ferns and salmon berry have come in thickly and chaparral is slowly gaining possession.

Sample plots were taken in the recently cut-over land that had not yet been touched by fire. The following tables were compiled from this data to show the actual amount of reproduction on this land. Each plot represents one fourth of an acre:

REPRODUCTION ON CUT-OVER LAND.

¼-acre plots.

Plot No. 1.

Stumps.			Species over 1 inch in diameter.				Seedlings.							Remarks.
							1 to 6 feet in height.					Under 1 ft. high.

Rate of Growth.

Whether forestry, as a business proposition, under present conditions, is feasible or not depends chiefly upon the time required in which to secure a second crop. The "skinny" or clear cutting method of universal practice in California removes all of the merchantable trees at one cutting without considering the minimum diameter below which cutting is undesirable. A tree 12 inches in diameter adds more new wood growth in a year than one but half this wide. And a very old tree ceases to make any material increase. There is some diameter for each species that represents the maximum rate of growth and volume obtainable in a minimum time. Studies of the rate of growth are made, then, with the view of determining the approximate diameter that trees of different species can be harvested with the greatest profit to the owner.

Many measurements must be taken to secure authentic data. Such detailed investigations could not be conducted this year. Sample plots were selected in average reproduction areas of sugar and yellow pines and white fir. After determining the age of the stand, the diameter and height of each tree was ascertained. The average diameter and height were then computed, and a tree, having these dimensions was selected, felled, and its exact age determined by ring counts.

These measurements show that sugar pine fifteen years old attains a total height of 7.8 feet and a diameter of 2.8 inches 1 foot from the ground and 1.4 inches at a point 4.5 feet from the ground. The area upon which these measurements were made was cut over twenty years ago. If another crop is to be harvested it is unnecessary to linger on the need for protection against fire.

Yellow pine reproduction, on the same cut-over area, was sixteen years old, and had attained an average diameter of 1.6 inches 1 foot from the ground and 0.3 inches at a point 4.5 feet from the ground. The total height was 4.8 feet.

White fir reproduction, on the same area, came in almost immediately after logging for the average tree was nineteen years old. Its diameter at a point 1 foot from the ground was 1.9 inches and 0.9 inches at a point 4.5 feet from the ground. The total height was 7.0 feet.

Few companies have large enough holdings to log so close as the Terry Lumber Company without having to wait for a number of years, after logging the last unit, before the first one cut-over is again ready for the axe. Sawmills cannot remain idle for a great length of time without serious deterioration.

Conclusions.

The Terry Lumber Company is not practicing conservative forestry. Their annual cut is not based upon the annual or periodical increment. No rotation has been established and timber is cut far faster than it produces. Reproduction is given no consideration, and no effort is being made to secure another crop, either naturally or artificially.

No disposition is made of the slash resulting from logging. It increases the fire risk and serves to increase the intensity of fire once started. When fire does occur, all reproduction will be destroyed.

There is no organized system of fire protection. None of the donkey engines or locomotives are equipped with spark arresters; the latter continually plying through inflammable slashings.

Because the present logging operations are conducted without reference to the silvical requirements of the various species, chaparral is fast gaining possession of the cut-over area to the exclusion of merchantable trees. Such areas present difficult and time-taking problems to the forester who would place such lands on a timber producing basis.

SIERRA NEVADA WOOD AND LUMBER COMPANY.

In General.

The examination of this tract was made late in the season and was necessarily brief. It was confined principally to the system of protection and the disposal and condition of the slash.

The company is operating, at present, in Sierra County. The entire holdings in Sierra, Nevada, and Placer counties comprise 65,680 acres, of which approximately 36,308 acres are virgin and 29,372 acres are cut-over. The offices and mill are located at Hobart Mills, about six miles north of Truckee, with which they are connected by a broad gauge railroad. A narrow guage railroad hauls the logs from the two camps, twelve miles northwest of Hobart Mills, to the mill.

The elevation ranges from about 6,000 feet to 8,000 feet above sea level. The slopes are not precipitous, but they are of such character as to make only donkey logging possible. The mill has a capacity of 175,000 feet board measure per day of ten hours.

Effect of Logging.

An approximate diameter limit of 14 inches has been established by the company, but trees are taken down to twelve inches if a good log can be secured. Such a limit means that everything of merchantable size is taken, leaving the area denuded.

A large per cent of the young growth is destroyed during logging operations. Much of this is due to carelessness in felling and skidding and could be avoided.

Fire Protection.

The improved property is well protected. The interior of the mill is equipped with automatic nozzles, and the grounds are well supplied with hydrants and reels of hose. All engines and locomotives have spark arresters. Watchmen are employed to guard against fire at night. Their number is increased at the camps when there is a high wind blowing.

The company does not protect its timber lands and several bad fires have occurred in recent years. The most serious one happened two years ago. It was due to negligence on the part of the company's foreman. It was located on a government cutting and cost the company about ten thousand dollars for damages. A fire like this is conclusive proof that protection pays in the long run.

Two mounted guards would be sufficient to patrol the entire tract. Competent men could be secured for $75.00 per month. The total cost for the dangerous season should not exceed $600. At this rate, the amount lost in the one fire would have protected the entire holdings for a period of seventeen years. And, in addition, the timber that was destroyed would have been saved to the company.

Disposal of Slash.

Most of the slashings on the old cut-over lands have entirely disappeared or are well advanced in decomposition and may not be considered dangerous. But the conditions are bad in the area along the Nevada County road, which was cut over about eight years ago. Here the slash, consisting of broken timber, long tops and branches were left in a jumbled mass and still constitute a serious menace to the reproduction.

The conditions are bad on all of the recently cut-over land. Trees are felled so as to be most accessible for skidding and the slash is left where it falls. No attempt is made to make any real disposition of it, or to lessen the danger to the young growth.

The company, at one time, cut all the branches and tops for fuel, but the additional cost of reloading from the narrow to the broad guaged cars at Hobart Mills made the practice unprofitable and it was discontinued. At present, the tops and the largest branches are cut into long lengths in the woods and sawed into stove lengths by an electrically driven saw for use at Hobart Mills. But not enough of the slash is disposed of in this way to greatly lessen the fire menace. The remainder should be piled away from the reproduction and burned, every fall, after the first rains.

Conclusions.

It is apparent, from a partial study, that this company is not practicing forestry on its holdings. No rotation of crops has been established and the cut is made without reference to the yield. The area is cut so close that no seed trees are left to produce a second crop. No system of fire protection has been established. No real disposal is made of the slash. A small per cent is removed for stove wood, but the remainder is left to form a constant menace to the reproduction.

VERDI LUMBER COMPANY.

In General.

The office and mill of the Verdi Lumber Company are located at Verdi, Nevada, but their timber lands are in the eastern part of Sierra County, California. The tract comprises 14,080 acres of which 4,640 acres are timber land and 9,440 acres are cut-over. Two logging camps are in operation. Camp No. 1 is situated on the line between sections 2 and 3, township 19 north, range 17 east, and Camp No. 2 is in section 1, township 20 north, range 17 east. The bulk of the cut-over land lies between these two camps. The elevation ranges from 4,900 feet at Verdi to approximately 8,000 feet at Crystal Peak. The slopes range from gentle to very steep and can only be logged with donkey engines. The logs are transported from the camps to the mill by a standard gauge railroad.

Fire.

There have been at least three general fires in this locality. Ring counts on the scarred stumps show that they occurred approximately fifty, sixty and seventy years ago, and the numerous charred stubs bear evidence of the extent of damage done by them. The company has been fortunate in recent years in this regard. There have been a few small fires that did a certain amount of damage to the young growth, but no areas of any great size have burned over.

The mill at Verdi is well protected, but the protection system for the timber lands is inadequate. The donkey engines are equipped with spark arresters, and watchmen are employed to look out for fires near the donkeys at night. Dead snags near the engines are cut to lessen the danger. But there is no patrol system during the dangerous season and if a fire should start at any distance from the camps it could easily get beyond control before being discovered and men sent out. The woods superintendent is constantly going between camps, and serves to some extent as guard, but at least one man should be hired during the dry months, whose duties should be purely patrol and extinguishing fires.

Reproduction.

Not enough seed trees have been left on the cut-over lands to reseed them properly. A fair growth of yellow pine is coming in on the old cuttings, but the largest per cent of this was there before logging. Chaparral is making but little headway, and does not interfere with reproduction. Even if a fire is kept out, the second crop will undoubtedly be much lighter than the original stand.

Forest Cover.

The forest cover on this tract occurs mostly in patches and is seldom dense enough to hinder reproduction. The species which occur generally throughout the stand are manzanita, buckthorn, ceanothus, mountain mahogany, gooseberry and chinquapin. Quaking aspens, willow, alder, elderberry, rose, and wild cherry were noted on the moist benches and along the streams. Sagebrush is the principal species of forest cover growing on the dry, open areas.

Ground Cover.

The ground cover in the virgin stand is very good, consisting of a thick layer of needles, humus and duff. On the cut-over lands the cover is thin and is mainly the result of the dropping of needles and the decomposition of the slash. Thimbleberry, cowcabbage, squaw-carpet, and Indian paint brush form the principal growth and these species do not occur in great abundance, except in limited areas.

Logging.

The method of logging is similar to that used by the M. A. Burns Lumber Company. The logs are hauled down dry chutes to the landing by donkey engines. The main chute is about a mile long and laterals are built to increase the area logged by the one chute. Twenty to thirty logs are hauled down the chute at one time by the main "bull" donkey. The logs are hauled from the landing to the mill by a standard guage railroad.

The company is cutting too close. Trees down to a breast high diameter of 15 inches are cut for lumber, and trees from 8 to 15 inches in diameter are cut for cordwood and ties. The land is practically denuded and no seed trees are left to produce a future crop. All species of merchantable sizes are taken. White fir is used principally for chute poles and ties.

A large amount of unnecessary damage is done to the young growth during logging. Trees are often felled in and skidded through thick clumps of seedlings. Most of this damage could be avoided, without expense, by exercising a little care.

The diameter limit for yellow pine should be increased enough to leave sufficient seed trees to reseed the area. The greater per cent of this land is fit for nothing but the growing of timber and more seed trees must be left to secure a second crop.

Waste in Logging.

This company has adopted a policy of very close utilization of its timber, and the unnecessary waste was less than in any other company examined. The stumps are cut down to a height of from 2 to 2½ feet and the tops are utilized to a small diameter. After all the available logs are taken, the remainder of the tops and the larger branches are cut up into cordwood. Inferior species, such as white fir, are cut for chute poles. When an area has been logged, the old chute poles are cut into ties.

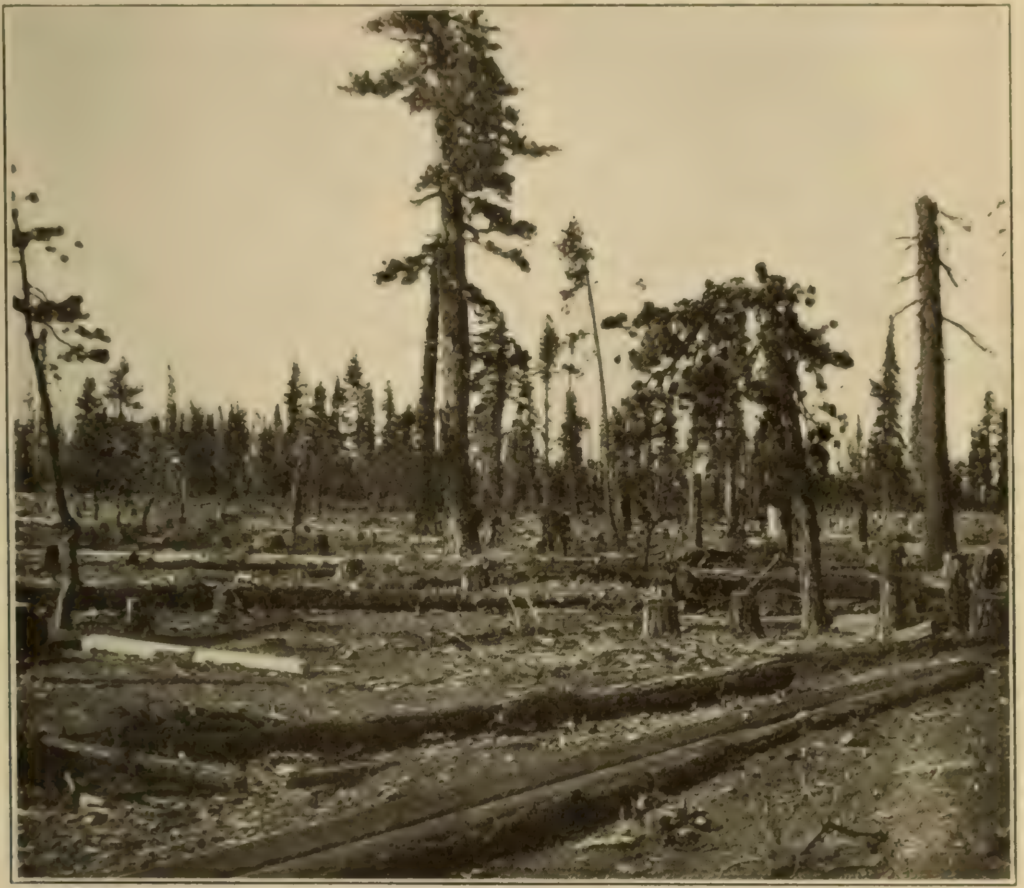

PLATE IX. Waste in logging.

Unused chute poles and long merchantable sections of timber left in the woods to rot. Several trees have been broken by careless felling. Note also the waste from high stumps. A large per cent of this waste could have been utilized at a profit. Several thrifty seed trees would have been left if care had been used in felling. Many of the chute poles could be cut into ties for the logging railroad.

The unnecessary waste can be still further decreased by reducing the height of stumps to from twelve to eighteen inches. Stump heights in this locality have already been lowered from 5 feet on the first cuttings, made forty years ago, to from 2 to 2½ feet at the present time and the limit has not yet been reached. It has been demonstrated on the National Forests that it is entirely practicable to cut down to a height of twelve inches, and the increase in stumpage prices is forcing the lumbermen to waste as little as possible. More care should be used in felling to prevent smashing the top logs. The slash could be more completely utilized for cordwood.

Disposal of Slash.

Nothing was done with the slash on the old cuttings. The branches were not lopped from the tops and the débris was left in a jumbled mass. It has decomposed fairly well, however, and at the present time does not constitute a serious fire menace.

In recent years, the company has utilized a large part of their slash by cutting into cordwood. The tops and larger branches are taken and the rest is left flat on the ground, where it will decompose more rapidly than when it was not lopped. It could be more closely utilized by taking the branches down to a smaller diameter. The remainder should either be more completely scattered or piled and burned each year.

Conclusions.

The Verdi Lumber Company is not practicing conservative forestry. It is cutting the timber without regard to increment. No attempt is made to produce a future crop. The present diameter limit takes practically everything, leaving the area denuded. No seed trees are left to reseed the area. No system of protection or management has been established.

The timber is being closely utilized. Stumps are low, and tops are taken to a small diameter. The slash is cut into cordwood. Old chute poles are cut into ties. The stump height should be still further reduced and more of the slash should be used for cordwood.

STANDARD LUMBER COMPANY.

In General.

The timber holdings owned or controlled by the Standard Lumber Company are located in townships 2, 3, 4 and 5 north, ranges 15, 16, 17 and 18 east, Mount Diablo meridian, Tuolumne County. Their holdings comprise 30,980 acres of timber. They own the land and timber on 15,661 acres, and the timber only on 15,259 acres. Approximately, 5,000 acres have been cut over. The company maintains its offices in Sonora. There also are located its sash, door and box factories. Three sawmills, located at Cold Springs, Empire Mill and South Forks, respectively, are operated by the company. These mills are all situated in the timbered area and, unlike the other companies investigated, where logs are hauled to some point and sawed into lumber, the timber is sawed in the woods. The company also owns two logging railroads; one the "Empire City Railroad," a 30-inch narrow gauge, and the other "The Sugar Pine Railroad," a 56-inch broad or standard gauge. Their operation will be discussed in detail later in this report.

The topography varies from rolling to steep. The area is traversed by small creeks which flow into the north fork of the Tuolumne River from the east and west.

The soil is a deep, moist, sandy loam, with an outcropping of granite boulders at infrequent intervals and a humus covering that varies in depth from ¼ to 1 inch. In many places, however, the humus is entirely absent.

The Standard Lumber Company cuts a great deal of Government timber, of which there is quite a quantity on the Stanislaus National Forest, and also buys timber on adjoining lands.

It will take about two years to finish up the operations in the Empire Mill—Gold Springs locality—and then cutting will be commenced on the properties farther north and west.

Fire and Slash.

This company has no fire protection system of patrols and no attention whatever is paid to the disposal of slash excepting in the case of Government timber, where the Forest Service regulations compel them to pile brush and in general clean up the area.

In this region where the company cuts so much timber belonging to others, one could not very well compel them to pile brush. However, a little foresight on the part of the owner when issuing a contract for timber, inserting a clause to have brush piled, would change an area which is now a fire menace to one where the danger from fire is reduced to a minimum.

The company is very careful, and every measure within reason is taken to avoid large fires. Prompt action is taken to extinguish all fires, especially in the vicinity of the mill and logging operations. Orders have been issued to cease everything in case of fire, and fight. This was amply proven on August 22, 1912, when the whole mill force at Empire Mill turned out to fight a fire of 30 acres.

Another important feature in the prevention of fires is the practice of watching logging donkeys. When it becomes necessary to move donkeys, each is followed by six or eight men to put out any fires which may be started. This is an extra precaution and one not always practiced by lumbering companies, for all donkeys as well as locomotives are equipped with modern spark arresters of the forced draft type.

"Log trails" coming down a chute oftentimes start fires due to friction, but men are always either riding the "trails" or going back up the chute in a "boat" and thus usually detect and put out fires so started. But logging operations in this locality will cease in two years and the slash on the entire logged area is in a bad way for future fires.

All the way from Longbarn to Bridgeport, along the beautiful Mono road, this menace is particularly noticeable. More especially does this apply to the area extending one half mile on each side of the road from Bald Mountain to Niagara.

The leaving of the logged-over area in this condition not only makes it very dangerous in case of fire, but also spoils the beauty of the road. The Government requires that a strip of timber 100 feet wide be left on each side of the road on its timber sale areas in this locality.

The Standard Lumber Company has cut all its timber near the Mono highway, leaving a desolate waste that one, riding or driving, cannot forget until reaching the summit. Trees could have been left, with very little expense, at least 30 to 50 feet on each side of the highway. In its present state the whole scene is an eyesore.

To further discuss the dangerous conditions existing here, one must bear in mind the topography of the tract and its distance from the nearest community. The holdings are located on the slopes of Dodge Ridge and Bald Mountain, which slope toward the north fork of the Tuolumne River. With the slash in its present dangerous condition, fire would meet with little resistance until it reached the Stanislaus River.

Sonora, the nearest town, is 26 miles distant, and in all probability a sufficient crew of men could not be transported to the danger zone in time to check its spread. In the mean time, a great deal of government as well as privately owned land would be destroyed. It is essential for the safety of these holdings that this slash be burned.

Forest and Ground Covers.

The forest cover consists of manzanita, deer brush, snow brush, bear clover, coffeeberry, chinquapin, greasewood, grasses, and ferns. As a whole, the cover and humus conditions are exceptionally good except on lava ridges, where it is usually absent.

The soil of the major part of the type is a deep, moist, sandy loam and is in good condition for natural reproduction, except the burned-over areas. In the white fir-cedar type the forest cover and ground cover are in good condition. On this type the forest cover consists of manzanita, western chokecherry, deer brush, snow brush, bear clover, grasses, and ferns. Humus conditions are good excepting on steep slopes, where it is usually absent.

The forest cover grows very thick on cut-over areas located near the tops of ridges and the lava beds.

Logging.

Logging operations are similar to those of any other steam logging proposition. Trees are felled, limbed, bucked into logs and yarded to the chute by means of donkey engines. From here the "log trail" is pulled down the chute by the bull donkey to the landing, and either rolled directly to a car and pulled up an incline to the log dock in the mill and sawed into lumber, as at the Cold Springs mill, or is loaded on to a narrow gauge car, hauled to the mill landing and rolled into the mill on the log deck and sawed, as at the Empire mill. The company has no log pond, but washes the logs by means of a 2-inch fire hose. A minimum diameter limit has been established, below which no trees shall be cut.

Pine is logged exceeding close, but white fir and cedar is generally left unless special orders are received for cedar ties. A second cut is not contemplated, so no rotation of crops has been established, and the annual cut is made without reference to the increment.

Waste in Logging.

The chief waste noted on this tract was that of the chute poles. No effort is made to choose non-commercial species for these poles. Many good sugar and yellow pine logs are used and then left to decay in the woods when operations cease. The company believes that the injury to saws and machinery in handling chute poles, which usually have sand and small stones pressed into them, is a greater expense than the sawed timber is worth. This is perhaps true, but it has been demonstrated by other companies that non-commercial species make satisfactory chute poles, and can be utilized later for ties and thus prevent unnecessary waste.

Aside from this waste, however, the timber is being closely utilized. Trees are carefully felled in order to smash as little as possible and the tops are taken down to a diameter of ten inches. Very few merchantable sections have been left in the woods. Stumps are cut down to a height of 18 to 20 inches.

As would naturally be expected with steam logging, this area is considerably torn up by snaking the logs from the woods to the chutes. On their own lands, the company pays no attention to second growth or reproduction.

Yarding lines are strung with the view of reaching the greatest number of logs from a single setting. This practice naturally causes considerable unnecessary damage to seedlings, saplings and poles. Logs snaked through young thickets smash or uproot everything in their path. The cables are heavy and nothing smaller than a tree 10 inches in diameter is looked upon in the nature of an obstruction. This form of damage can be practically eliminated by a more judicious selection of donkey sites and by more frequent settings. Some additional expense would be incurred but, in the long run, the more conservative and less destructive practice would pay.

Fungi and Insects.

No extensive body of fungi killed timber was found. On the whole, this property is quite free from such depredations. Cedar, however, is in bad condition, but this is a general defect that exists pretty much throughout its natural range in California. But little is known of the fungus attacking cedar, and no attempt has been made to determine practical methods for its control. There is an opportunity for much practical work in this field of investigations. Many problems need the earnest attention of a plant pathologist, and provisions should be made whereby the Forestry Department can undertake, in a systematic manner, a thorough study of fungi affecting the merchantable species of California.

Forest insects, detrimental to standing timber, have destroyed no timber worthy of mention. Various species of bark borers were noted in individual trees. Their numbers were not sufficient to kill groups of trees, and no old "deadings" were observed.

Second Growth.

Several one quarter acre sample plots were taken on representative cut-over land of different ages to show more plainly the actual amount of reproduction coming in. The number of trees over one inch in diameter were counted and tallied by species. The resulting figures show that enough second growth is present on most of this tract to produce a fairly good future crop if fire is kept out. A study was also conducted of the rate of growth of the reproduction. These figures serve as an indication of the length of time that must elapse before the area will again be ready to cut.

Sample Plot No. 4—7 year cutting.—Yellow pine is coming in very thickly, closely followed by sugar pine and cedar. The area is badly in need of protection for a fire now would most certainly destroy the growth.

The amount of second growth is as follows:

Species—	Number.
Sugar pine, 1 to 6 inches in diameter	61
Yellow pine, 1 to 6 inches in diameter	62
White fir, 1 to 4 inches in diameter	29
Cedar, 1 to 4 inches in diameter	31

Rate of growth as determined by stem analysis of an average tree from the area showed the following: Sugar pine, 34 years of age, 3.2 inches diameter outside bark at stump (1 foot high) and a height growth of 13.5 feet.

Sample Plot No. 3—7 year cutting.—Yellow pine very thrifty here also. Amount of growth as follows:

Species—	Number.
Sugar pine, 1 to 6 inches in diameter	40
Yellow pine, 1 to 9 inches in diameter	55
White fir, 1 to 7 inches in diameter	25
Cedar, 1 to 4 inches in diameter	14

Rate of growth on above: Yellow pine, 37 years of age, 4.5 inches diameter outside bark at stump height, and a height growth of 15 feet.

Sample Plot No. 2—5 year cutting.—Yellow pine again predominates with a good thrifty growth. Amount of growth:

Species—	Number.
Sugar pine, 1 to 5 inches in diameter	83
Yellow pine, 1 to 7 inches in diameter	190
White fir, 1 to 7 inches in diameter	15
Cedar, 1 to 4 inches in diameter	30

Rate of growth: A yellow pine, 33 years of age had a diameter of 3.15 inches diameter outside bark at one foot stump and a height of 12.3 feet.

Sample Plot No. 1—5 year cutting.—This area resembles sample plot No. 2 a great deal in character, the yellow pine and sugar pine being present in goodly quantities. Amount of growth:

Species—	Number.
Sugar pine, 1 to 5 inches in diameter	142
Yellow pine, 1 to 5 inches in diameter	70
White fir, 1 to 6 inches in diameter	111
Cedar, 1 inch in diameter	1

Rate of growth: A sugar pine, 26 years of age, had a diameter of 3.0 inches outside bark at one foot stump and a height growth of 10.5 feet.

Reproduction on Recently Cut-over Land.

The purpose of these reproduction studies on recently cut-over land is to determine the amount of reproduction and the number of thrifty trees left on the ground after logging. A comparison of these figures with the stand tables made in the virgin timber shows that from 50 to 75 per cent of the reproduction is destroyed during logging operations.

In each case a plot of one quarter acre was laid off. The diameter and height of each stump was measured and with the chaparral and standing trees over 1 inch in diameter was accurately plotted on a map. The seedlings (under one inch in diameter) were counted by species.

The following tables were compiled from these figures. It needs only a glance at these tables to perceive that no provision is being made for a future crop:

REPRODUCTION ON RECENTLY CUT-OVER LAND.

Plot No. 1.

Stumps.			Species over 1 inch in diameter.					Seedlings.				Remarks.
								1 to 6 feet in height.		Under 1 ft. high.		
Species.	Height (feet).	Diameter outside bark (inches).	Diameter breast high (inches).	Sugar pine.	Yellow pine.	White fir.	Cedar.	Species.	Height (feet).	Species.	Number.	
Yellow pine	3.1	22	2			3		Sugar pine	1.5	Sugar pine	10	
Yellow pine	2.0	27	3			3		Sugar pine	2.4	Yellow pine	4	
Yellow pine	3.3	25	4			1		Yellow pine	1.4	White fir	56	
Yellow pine	2.5	23	5	1			1	Yellow pine	2.0	Cedar	4	
Yellow pine	2.3	12	6		1	1		Yellow pine	1.3			Torn and smashed.
White fir	7.1	36	7			1						Girdled and dying.
			8		1							Girdled by guy lines.
			14		1							
			18		2							
			20		1							

Plot No. 2.

Species.	Height (feet).	Diameter outside bark (inches).	Diameter breast high (inches).	Sugar pine.	Yellow pine.	White fir.	Cedar.	Species.	Height (feet).	Species.	Number.	Remarks.
Sugar pine	2.75	48	24				1			Sugar pine	6	Dead top.
Yellow pine	3.0	46								Yellow pine	3	Area is being reseded by timber on adjacent government land.
Yellow pine	2.75	50								White fir	7	
Yellow pine	3.0	38										
Cedar	2.5	47										
Yellow pine	2.1	40										
Yellow pine	2.5	28										

Plot No. 3.

Sugar pine	2.8	42	2			1		Sugar pine	1.5	Sugar pine	22	
White fir	2.5	33	4			1		Sugar pine	1.3	Yellow pine	6	
White fir	2.1	19	20				1	Sugar pine	1.7	White fir	54	Dead; badly burned at butt.
Cedar	2.1	26	22		1			Sugar pine	2	Cedar	26	Top broken; alive.
White fir	2.5	30	23			1		Sugar pine	1.5			Top broken; dead.
White fir	2.8	40	25			1		Sugar pine	2.0			
			26			2		Sugar pine	2.0			Both dead and smashed.
			34			1		Sugar pine	1.0			Top broken; dead.
			36			1		Sugar pine	1.0			Shaky butt; alive.
			38			2		Yellow pine	3.0			Dead.
			42			1	1	Yellow pine	1.7			White fir dead; cedar alive, burned at butt.
								Yellow pine	2.0			
								White fir	1.3			
								White fir	1.5			
								White fir	3.0			Area needs protection from fire.
								White fir	2.0			
								White fir	2.5			
								White fir	2.0			
								White fir	1.1			
								Sugar pine	3.0			
								Sugar pine	3.0			
								Sugar pine	3.0			
								Sugar pine	3.0			

Conclusions.

The most important condition to consider on this tract is that of disposal of old as well as new slash. The entire cut-over area is in a dangerous condition, especially in the vicinity of the Mono highway. The menace is increased by the fact that logging operations will soon cease and help will not be available in case of fire. The slash, in at least the most dangerous locations, should be piled and burned before the company leaves this vicinity.

Forestry is not practiced by this company. The cut is made without reference to yield. The lands are not adequately protected from fire, and no rotation of crops is carried on. No attention is paid to the producing of a second crop, and no seed trees left to reseed the land. Natural reproduction is excellent in this locality, and an adequate system of protection would be sufficient to insure at least a fair future stand of timber.

WESTSIDE LUMBER COMPANY.

In General.

The Westside Lumber Company, successors to the Westside Flume Lumber Company, own 54,670 acres in the central part of Tuolumne County. Of this 39,590 acres are timber land and 15,080 acres have been cut over. The original company commenced cutting operations in 1900 and continued until 1903, at which time the present company obtained possession. The tract, which is located on the drainage basin of the Tuolumne River, is rough and mountainous, cut by narrow cañons and small tributary streams heading in this locality. The elevation ranges approximately from 3,400 to 5,500 feet above sea level. Logs are hauled from the camps to the mill at Tuolumne, a distance of 28 miles, by a narrow gauge railroad. The mill has a capacity of 250,000 feet board measure per day. From here the finished products are shipped via Sierra Railroad to Oakdale and thence via Southern Pacific Railroad to destination.

Fire

Several bad fires have occurred on this tract in recent years. The most serious one burned over 600 to 800 acres near "Little Chicago," about five years ago. All the second growth, composed chiefly of yellow pine and white fir, with the exception of occasional seedlings which were protected by big rocks, was destroyed and chaparral is slowly gaining possession of the area.

Another bad fire broke out this summer (1912) near Camp. No. 22, burning over an area of 500 or 600 acres. The soil cover and reproduction were entirely destroyed and three or four inches of ash cover the ground in most places. Unless this area is planted it will undoubtedly remain a waste and be taken possession of by chaparral.

The locomotives and donkey engines, though equipped with spark arresters, have been the means of causing several fires. Several have been due to incendiarism, but the offenders were never caught.

No organized system for protection is maintained. However, the company endeavers to prevent fires as far as is possible without such a system. In addition to equipping the locomotives and engines with spark arresters, the trainmen, grading crew and other employees have strict orders to put out all fires and the whole crew has been called out on several occasions. No patrol is kept on the railroad right of way. When a fire is too large to be handled by the section or grading crews, a general alarm is sounded and the entire woods crew responds. It is usually fought by means of trails and back-firing.

At least two men, whose duties are purely patrol, should be hired during the summer months. The company would then be insured against a repetition of disastrous fires such as the two described above. These men could locate a fire and get a crew to the danger zone before it gained headway.

Forest Cover.

Several species of chaparral were found in this locality. Manzanita occurs in small patches in openings of the forest and occasionally along old roads and railroad beds. Bear clover is thickly scattered over the entire timbered area, especially in the openings. As a rule, seedlings will not grow under thick bear clover. Deer brush and buck brush occur in a few scattered patches along with manzanita, near old chutes and tops of ridges. Sorrel and mullen grow along the railroad, but do not interfere with reproduction. Scrub or mountain oak, elderberry, gooseberry and aspen, with various small flowering plants, occur in openings on the slopes, beside the streams and in the canyons.

Grazing.

The Westside Lumber Company leases its cut-over land for grazing purposes. A policy similar to that of the government has been adopted which prevents overgrazing the allotted range. Approximately 10,000 acres are used for this purpose. Several drift fences have been built, and as grazing is permitted only during the summer months, the injury to young growth is reduced to a minimum. The stockmen strongly oppose the burning of cut-over land for, when it is done, the carrying capacity of the range is reduced. Since the stockmen are anxious to graze as many head per acre as possible, they offer active assistance in fire detection and protection and, if necessary, in fighting fire.

Logging.

Because of the rough character of the country logging is done entirely with donkey engines. The original company logged under a selection system, removing only the largest and best trees, and a good pole stand, with an abundance of reproduction, remains. The older cuttings, up to 1905 or 1906, of the present company, are in much the same condition, but as operations have proceeded north into townships 2 and 3 north, range 17 east, a smaller cutting diameter has been adopted. As a result, in a region where white fir and yellow pine are about on a par for predominance in the forest type, white fir and cedar are forming the principal components of the second crop.

Only one logging camp is run at a time. The logs are hauled up greased chutes to the landing. These chutes are usually built of white fir, but yellow and sugar pine are oftentimes used. When operations are through, the fallers buck up the good pine and haul it in the same as other timber, or if not too far to move, it is used in other chutes.

There is no standard diameter cutting limit. It depends on the market and demand. If the company has a big order for cedar, orders are issued from the office to cut anything worth taking, fence-post material, etc.; the same is true of other species. However, during the investigation no trees under 14 or 18 inches were being cut.

Waste in Logging.

An unusual amount of tops of large diameters are smashed in falling, due to timber being felled downhill. This is often unavoidable, but in many cases it is the result of carelessness or indifference on the part of the faller. A tree is broken more or less in merely falling, but to make it worse, another possible log or two is smashed by sliding 100 to 150 feet down the slope and crashing into other timber.

There is also a great unnecessary waste in the logging chutes. All but the best yellow pine poles are left to decay in the woods. Many of these poles could easily be cut into ties for their railroad.

The chief damage is undoubtedly that done to the young growth by the yarding operations. Much of this is unavoidable, but the damage is great because of the thickness of the young growth. Young trees are uprooted, broken and bent over. The soil is badly plowed up, killing whatever reproduction was present and leaving openings in the thick stands of yellow pine.

Sample plots were taken on representative cut-over land in order to show graphically the actual waste. Each sample plot represents one quarter acre of cut-over land. The species of each stump was noted, its diameter and height were taken; the length of the unused top and the unused merchantable section (or length of top down to a 6-inch diameter) were measured. It may be seen from these measurements that a merchantable section ranging from 12 to 26 feet in length was left in each top. Some of these sections were broken by careless felling, but a good log could have been secured from the others. Each tree over 6 inches in diameter left standing was also measured and its condition noted. These figures show that no sound trees of sufficient size to reseed the area have been left.

WASTE IN LOGGING.

Sample Plot 1.

Stumps.			Unused tops.		Unused merchantable section.		Trees 6 inches and over in diameter left standing.			
Species.	Diameter outside bark, (inches).	Height (feet).	Total length of top (feet).	Diameter outside bark at butt end (inches).	Length to 6 inch diameter (feet).	Diameter outside bark at butt end (inches).	Species.	Diameter breast high (inches).	Condition.	Remarks.
Yellow pine	30	2.5	52	18	37	18	White fir	6	Good.	*Unused portion of yellow pine, 36-inch diameter, badly smashed. Unused portion of yellow pine, 47-inch diameter, badly smashed; no good.
Yellow pine*	36	2.4	62	19	40	19	White fir	8	Good.	
Cedar	48	3.2	58	20	38	20	White fir	7	Good.	
Cedar	39	2.9	53	18	34	18	Yellow pine	6	Good.	
Sugar pine	52	3.0	63	22	42	22	Yellow pine	6	Good.	
Yellow pine†	47	2.8	68	26	54	26	White fir	7	Good.	†This area was covered with a thick stand of yellow pine.
Sugar pine	28	2.5	46	16	28	16	Yellow pine	12	Good.	
							Yellow pine	14	Good.	
							Yellow pine	10	Good.	
							Sugar pine	8	Good.	
							Sugar pine	6	Good.	
							Yellow pine	7	Good.	
							White fir	6	Good.	White fir saplings and poles.
							Sugar pine	8	Good.	

Sample Plot 2.

Stumps.			Unused tops.		Unused merchantable section.		Trees 6 inches and over in diameter left standing.			
Species.	Diameter outside bark, (inches).	Height (feet).	Total length of top (feet).	Diameter outside bark at butt end (inches).	Length to 6 inch diameter (feet).	Diameter outside bark at butt end (inches).	Species.	Diameter breast high (inches).	Condition.	Remarks.
Sugar pine[1]	43	2.5	37	12	11	12	Cedar	48		[1] O. K. in form but poor.
Yellow pine[2]	29	1.5	34	14	18	14	Oak	30		[2] Crooked; top broken. Smashed.
Yellow pine[3]	54	2.0	58	22	34	22				[3] Badly smashed.
Yellow pine[4]	51	2.5	62	24	36	24				[4] First log fair, rest smashed.
Yellow pine[5]	30	1.3	48	20	24	20				[5] Badly smashed; beyond measuring.
Yellow pine[6]	36	1.2	57	24	34	24				[6] Forked at 24 inches, making top extra long.
Yellow pine[7]	44	2.9	55	22	30	22				[7] Badly smashed.

NOTE. This area is located on steep slope, hence in felling nearly all tops over 24 inches in diameter were smashed. Eighty acres in this vicinity is in the same condition.

Disposal of Slash.

No attempt is made to dispose of the slashings. It is considered too great an expense to pile and burn, and the problem is handled in this manner. Every fall, after the first rains, their dangerous cut-over areas are burned broadcast. It is the opinion of the company that this method does no damage to reproduction or ground cover at this season of the year. They believe that while it may kill many seedlings, they will come up much faster the next year because of the improved condition of the soil. Nearly all of their cut-over lands of the past 6 or 7 years have been burned over, and taken as a whole, are in excellent condition to produce a future crop, providing that fire is kept out.

Fungus and Insect Damage.

There is apparently no damage due to these agents with the exception of the unknown, or little known of, fungus which causes the perforation of cedar. All cedar seems to be subject to this fungus. The larger trees, and more or less the medium sized ones also, are often riddled as if by an insect. However, there seems to be a ready sale for cedar for use in making ties, telphone poles, and fence posts. The quality of cedar in this region is better than the average.

Reproduction.

Sample plots of one quarter acre each were taken on the various aged cut-over areas in order to show exactly what is coming in to form the second crop. The number of each species present was determined and the diameters measured. A stem analysis was then made of a tree of average size for each plot. It was cut into one-foot sections and the age of each section was determined by ring counts. These figures serve as an indication of the rate of growth of the reproduction and give an idea of the length of time that must elapse before the cut-over land will again be ready to log.

Sample Plot No. 1—5-year cutting.—This area is rapidly being reforested with yellow pine, sugar pine and cedar, and is in good condition for a second crop. The amount of second growth is as follows:

Species.	Number.
Sugar pine, 1 to 6 inches in diameter	28
Yellow pine, 1 to 11 inches in diameter	49
White fir, 1 to 6 inches in diameter	39
Cedar, 1 to 4 inches in diameter	28

Rate of growth: for the average tree, a yellow pine of 4.5 inches diameter at one foot from the ground was taken. This tree had a total height of 13.1 feet and was found to be 30 years old.

Sample Plot No. 2—6 year cutting.—This area was also in excellent condition to produce a second crop. The amount of second growth was as follows:

Species.	Number.
Sugar pine, 1 to 5 inches in diameter	29
Yellow pine, 1 to 14 in diameter	106
White fir, 2 inches in diameter	1
Cedar, 1 to 6 inches in diameter	15

Rate of growth of area as determined by stem analysis: Cedar, 33 years of age, 5.3 inches diameter stump height and 12.3 feet high.

Sample Plot No. 3—10 year cutting.—Portions of this area were taken possession of by chaparral. The area has been burned over but conditions have been so ideal, the ground being flat or rolling and being near an abundance of timber, that the area is rapidly being reforested by yellow pine.

Amount of second growth found (the area will not show many seedlings because of a portion being solely chaparral):

Species.	Number.
Sugar pine, 1 to 9 inches in diameter	34
Yellow pine, 1 to 8 inches in diameter	134
White fir, 1 to 8 inches in diameter	18
Cedar, 1 to 10 inches in diameter	36

Rate of growth: Sugar pine, 34 years old, 6.5 inches diameter stump height and 16.4 feet high.

Sample Plot No. 4—12 year cutting.—Has a good pole and sapling stand with many trees 18 to 30 inches in diameter to reseed the area. No fires have been through here and the area is in fine shape for a second crop. Amount of second growth found:

Species.	Number.
Sugar pine, 1 to 8 inches in diameter	24
Yellow pine, 1 to 13 inches in diameter	39
Cedar, 1 to 4 inches in diameter	104

Rate of growth: Yellow pine, 15 years of age, 5 inches diameter stump height and 17.2 feet high.

Many seedlings, saplings, and second growth in general were destroyed in logging. In many cases this is unavoidable but, as a rule, more care could have been taken.

In comparison with seedling counts made in virgin timber, the cut-over seedling counts show a destruction of 60 to 75 per cent of the undergrowth.

Reproduction on Recently Cut-over Land.

Reproduction studies were made on recently cut-over land to determine the amount of reproduction and the number of trees left after logging. Each sample plot contains one quarter acre and was selected to represent average conditions. The diameter and height of each stump was taken and its species noted. Stumps, chaparral and trees over 1 inch in diameter were accurately plotted on a map, while the seedlings were counted and recorded by species. The results show that no seed trees of the valuable species have been left to reseed the land. Enough young growth is present to produce a fair stand if the area is well protected, but a fire of any consequence would be disastrous.

The following tables were compiled from this data and showed at a glance the deplorable lack of thrifty seed trees:

REPRODUCTION ON RECENTLY CUT-OVER LAND.

Stumps.			Species over 1 inch in diameter.					Seedlings.				Remarks.
								1 to 6 feet in height.		Under 1 ft. high.		
Species.	Height (feet).	Diameter outside bark (inches).	Diameter breast high (inches).	Sugar pine.	Yellow pine.	White fir.	Cedar.	Species.	Height (feet).	Species.	Number.	
Plot No. 1.												
Yellow pine	2.8	40	1	3	3	6	9	White fir	3	Sugar pine	17	Many yellow and sugar pine and white fir saplings, 1 to 7 inches in diameter, which were dead and broken, due to logging, found on this plot.
Yellow pine	2.2	36	2	1	2	5	8	White fir	4	Yellow pine	56	
Yellow pine	2.2	38	3	2	3	5	2	White fir	5	White fir	3	
Yellow pine	2.3	27	4	1		3	2	White fir	6	Cedar	42	
Yellow pine	2.4	52	5		1	3	2	White fir	4			
Yellow pine	2.4	25	6	1		3		White fir	3			
Yellow pine	2.5	43	7		1	2	1	Yellow pine	2			
Yellow pine	1.8	24	56				1	White fir	3			
White fir	1.8	10	60				1	White fir	3			
Cedar	2.0	32						White fir	5			
White fir	2.1	11						Sugar pine	6			
Yellow pine	2.5	21						Cedar	5			
								Yellow pine	6			
								Cedar	1			Shaky and burned butt.
								Cedar	1.5			Dead top; fairly good.
Plot No. 2.												
Yellow pine	3.0	50	1	3	2	6	7	White fir	5	Sugar pine	15	A great deal of slash on Plot No. 1. and much of the second growth is broken, bent, and dying because of logging.
Yellow pine	2.6	40	2	1	2	1	8	White fir	4	Yellow pine	10	
Yellow pine	2.3	44	3	2	1	1	2	White fir	5	White fir	97	
Sugar pine	2.4	50	4	2			4	Sugar pine	4	Cedar	92	
White fir	2.5	40	5	1		1	2	Cedar	2			
Yellow pine	2.0	40	6				1	Sugar pine	3			
White fir	2.5	30	7	1		1		Cedar	5			
White fir	2.8	38	8		1			Cedar	4			
			10			1		White fir	2			
			18			1		White fir	5			
			20			1		Cedar	4.5			
			26			1		White fir	6			
			36			1		White fir	5			
								Cedar	4			
								Cedar	2			
								Cedar	3			
								Sugar pine	2.5			

Conclusions.

The Westside Lumber Company is not practicing conservative forestry. Their cut is made without reference to the yield. No system of management or protection is in operation. Future yield is being left to chance.

No diameter limit has been established. Practically everything is cut from which a log can be secured. Although the reproduction is good on most of the cut-over land, there are denuded areas where planting will be necessary to produce a second crop.

More care should be exercised in felling timber. The present method of felling down hill causes a great amount of damage.

The system of fire protection now in operation is inadequate. At present, unless a fire is large and endangering company timber or improved property, it is given but little attention and is left to burn itself out.

THE HUME-BENNETT LUMBER COMPANY.

In General.

The Hume-Bennett Lumber Company, successors to the Sanger Lumber Company, own approximately 22,240 acres of land in the southeastern part of Fresno County. Of this amount, 5,280 acres are timber land and 16,960 acres have been cut over. The original company commenced cutting in 1890 and continued until 1905 when the present company took possession. The elevation of this tract ranges from 5,000 to 6,200 feet above sea level. The country, with the exception of a few basins and broad, rolling hilltops, is rocky and mountainous with narrow cañons and steep-sided ridges.

Logging operations center about Hume, situated on the shores of Lake Hume, 58 miles from Sanger. The lake was artificially made by damming a natural basin into which flow Ten-mile Creek and one or two smaller creeks. It is used as a mill pond and to furnish water for the flume between Hume and Sanger.

Fires.

With the exception of one that burned over between 80 and 100 acres of cut-over land within a half mile of Hume about three years ago, there have been no bad fires on this tract in recent years. This fire was checked before it reached the timber, but a fine stand of yellow and sugar pine reproduction was destroyed and the area is now in possession of the chaparral.

An inadequate system of protection is maintained. No general system of patrol has been established, but the railroad right of way is patroled by a force of two to six men during the dangerous season. Although the locomotives are equipped with spark arresters, the largest per cent of the fires occur along the right of way. With this system most of the fires are discovered in their incipiency and can be handled by the patrol. In the case of a large fire, prompt assistance can be secured for the camps are within a radius of five miles of the sawmill and are connected by telephone.

While such a method of protection is perhaps adequate at the present time, it is only a matter of a few years before the company will cease operations in this locality. The entire tract is in a dangerous condition because of the unburned slash. This danger increases yearly and will be at a maximum at just the time the company ceases cutting and withdraws its patrol. If these lands are not protected in the future the possibility of securing a second crop is extremely remote. With the area in its present condition almost any sort of fire would destroy practically all reproduction. This is one of the strongest arguments for State protection of the cut-over lands. An efficient patrol maintained by the State would eliminate these disastrous fires and insure a future supply of timber to the people of California. A large per cent of the cut-over lands are fit for nothing but the growing of timber and the lumbermen will not pay taxes and protect them for the length of time necessary before another crop can be harvested. Much of this land will eventually revert to the State. It is obvious that the protection of this land is of great value. "The indirect protective influences of the forest, the continued supply of a certain amount of useful products, the maintenance of certain industries which could not otherwise continue to exist in this region, are all of great advantage to the people and contribute largely to the actual creation of wealth and prosperity. They justify public forestry even if they involve a continued outlay of money."*

---

*Henry S. Graves: "Principles of Handling Woodlands."

Forest Cover.

The species of chaparral found on this tract are manzanita, buckthorn, chinquapin, snow brush and buck brush. It does not grow in abundance in the virgin forest, but occurs in the openings, on the tops of ridges, above timber, and on cut-over land. As yet, the forest cover is doing no harm to reproduction. Yellow pine, white fir and cedar are making a rapid growth on the cut-over lands and most of the chaparral will probably be driven out in a few years.

Ground Cover.

The ground cover is composed of needles, duff and humus, forming a layer several inches in thickness throughout the entire forest. Various small flowering plants such as the tiger lily grow in the moist situations. The cover is in excellent condition and with the sandy loam soil makes ideal germination conditions.

Logging.

The operations of the original company were very destructive. They removed only the best logs and necessarily left much valuable timber in the woods. Many of the trees were left on the "big tree" tract because the steepness of the slopes would not allow a profitable cutting. As a result, the area is now covered with a fair stand of young "big trees" and if fire is kept out, will soon resume its value as a watershed.

A more conservative policy has been adopted by the present company. An approximate diameter limit of 14 inches has been established and tops are taken down to a small diameter. The logs are yarded to the "chutes" by donkey engines or are taken directly to the landing with "high wheels." From the landings, they are hauled to Hume and dumped into the mill pond. After the lumber is sawed, it travels by flume in "clamps" to Sanger, where it is piled and shipped via Fresno on the Southern Pacific to the market.

From the standpoint of conservative forestry, the present diameter is too small. Very few seed trees are left to reseed the denuded areas. The few thrifty trees that are left after logging are taken by the tie cutters for their railroad.

Waste in Logging.

A large per cent of the large growth is destroyed by carelessness in logging. Many small trees are smashed by falling timber. Others are bent over, bark and branches are torn off, or torn up by the roots by reckless yarding. Some of this damage is unavoidable but much of it can be prevented.

Considerable timber is smashed in falling. Part of this damage could be avoided by using more care. Much of the broken timber, now going to waste, could be used for firing the donkeys.

Sample plots of one quarter acre each were taken in representative localities to show the actual waste left on the ground. The stumps were measured to determine the lengths left, which could have been utilized. Many tops were found, from which another log could have been secured, and ties could have been made from many more. The tie cutters consider the tops too knotty to hew into ties and instead go over the cut-over lands, taking the good trees that the loggers have missed. Many good seed trees would have been saved if the tie cutters were made to utilize the tops left in the woods. The following tables show the principal forms of waste. They also give an idea of the number of trees of each species over six inches, left after logging. It is from these trees that a large part of the area must receive its seed for the future stand:

WASTE IN LOGGING.

Stumps.			Unused tops.		Unused merchantable section.		Trees 6 inches and over in diameter left standing.		
Species.	Diameter outside bark (inches).	Height (feet).	Total length of top (feet).	Diameter outside bark at butt end (inches).	Length to 6 inch diameter (feet).	Diameter outside bark at butt end (inches).	Species.	Diameter breast high (inches).	Condition.
Plot No. 0.									
Sugar pine	38	3.0	35.7	12	13.7	12	White fir	12	Alive; uninjured.
Yellow pine	30	3.5	30.0	13	12.2	13	Cedar	8	Alive; dead top.
Yellow pine	28	3.0	34.6	14	6.0	14	Yellow pine	14	Dying; top broken.
Cedar	36	3.5	17.1	5	None.		Yellow pine	8	Dying; top bent.
Sugar pine	58	2.75	40.4	17	22.4	17	Cedar	28	Alive; dead top.
Cedar log	12 feet long and 39 inches in diameter.								Rather shaky; useless.
							Cedar	32	Dead on one side; shaky butt.
							White fir	12	Alive; undamaged.
Plot No. 1.									
Sugar pine	30	2.0	62.0	21	37.0	21	Yellow pine	6	Good.
Yellow pine	41	1.5	38.0	6	None.		Yellow pine	5	Good.

White fir	26	2.3	35	8	7	8			
Plot No. 3.									
Cedar	28	3.0	36	14	22	14	Yellow pine	6	Good.
White fir	30	2.8	30	16	20	16	Yellow pine	7	Broken top.
Yellow pine	20	2.7	50	15	38	15	Yellow pine	9	One half broken off by falling tree.
Yellow pine	21	3.0	46	15	30	15	Cedar	22	Good.
Sugar pine	24	2.3	38	18	18	18			
Sugar pine	32	3.0	42	17	23	17			
Cedar	44	3.6	54	21	36	21			

Disposal of Slash.

No disposal of slash is made by this company. The branches are not lopped from the tops and the débris is left in a badly jumbled mass. As a result, the entire cut-over area is in a dangerous condition. While the company remains in this locality the menace is minimized for the tract is fairly well protected, but the time is not far away when operations will cease and the company will seek other areas. A fire then would burn unchecked and do inestimable damage to the second growth. Slash is, unquestionably, the most serious existing menace to second growth and should be burned each year in order to give the land a better chance to bear another crop of timber.

Reproduction, Second Growth.

Several one quarter acre sample plots were taken on representative cut-over land of different ages to show more plainly the actual amount of reproduction coming in. The number of trees over one inch in diameter were counted and tallied by species. The resulting figures show that enough second growth is present on most of this tract to product a fairly good future crop if fire is kept out.

A study was also conducted of the rate of growth of the reproduction. These figures serve as an indication of the length of time that must elapse before the area will again be ready to cut.

Sample Plot No. 1, near Indian Basin—Cut-over in 1901. The amount of second growth is as follows:

Species.	Number.
Yellow pine, 1 to 13 inches in diameter	107
White fir, 2 to 3 inches in diameter	6
Cedar, 1 to 5 inches in diameter	12

The average tree for this tract was 3.93 inches in diameter and 14.74 feet in height.

Sample Plot No. 2—6-year cutting:

Species.	Number.
Sugar pine, 1 to 2 inches in diameter	6
Yellow pine, 1, 2 and 3 inches in diameter	5
White fir, 1 to 7 inches in diameter	12
Big Trees, 1 to 11 inches in diameter	20

The average tree was 2.96 inches in diameter and 9.72 feet high.

Sample Plot No. 3, Converse Basin—16 year old cutting:

Species.	Number.
Sugar pine, 1 to 8 inches in diameter	21
White fir, 1 to 7 inches in diameter	48
Big trees, 1 to 6 inches in diameter	9

The average tree was 3.5 inches in diameter and 14.2 feet high.

Sample Plot No. 4, near Millwood, Sequoia Lake—22 year old cutting:

Species.	Number.
Sugar pine, 1 to 5 inches in diameter	8
Yellow pine, 1 to 15 inches in diameter	56
Cedar, 1 to 10 inches in diameter	101
White fir	2

The average tree was 4.54 inches in diameter and 15.46 feet high.

Reproduction on Recently Cut-over Land.

Reproduction studies were made on recently cut-over land to determine the amount of reproduction and the number of trees left on an area after logging.

In each case a plot of one-quarter acre was laid off, stumps were measured and with chaparral and trees left, over 1 inch in diameter were accurately plotted on a map. The seedlings, those trees under 1 inch in diameter were counted by species.

The following tables were compiled to show the results of these studies on each plot:

REPRODUCTION ON RECENTLY CUT-OVER LAND.

Plot No. 1.

Stumps.			Species over 1 inch in diameter.					Number of seedlings under 1 inch in diameter.				Remarks.
Species.	Diameter outside bark, (inches).	Height. (feet).	Diameter breast high, (inches).	Sugar pine.	Yellow pine.	White fir.	Cedar.	Sugar pine.	Yellow pine.	White fir.	Cedar.	
			1	11	7	9	36	72	14	37	63	This area was formerly composed of yellow pine, white fir, cedar, and some sugar pine. Cedar and white fir reproduction abundant.
White fir	42	2.0	2			1						
Yellow pine	28	2.5	3									
Yellow pine	14	2.5	4			1						
			5				1					
			6									
			7	1		1	2					

Plot No. 2.

Species.	Diameter outside bark, (inches).	Height. (feet).	Diameter breast high, (inches).	Sugar pine.	Yellow pine.	White fir.	Cedar.	Sugar pine.	Yellow pine.	White fir.	Cedar.	Remarks.
White fir	24	2.4	1	9	9	6	5	18	11	15	107	Elevation: 5,500 feet. Reproduction is not very good, and white fir and cedar undoubtedly will be the next crop. Original stand was composed chiefly of yellow pine and cedar with subtype of sugar pine and white fir. The young growth has been damaged considerably by skidding, yarding, felling, guy lines, etc., which could have been avoided. Ground cover: 3 to 4 inches of needles and duff on top of subsoil of black loam.
Sugar pine	30	2.5	2	1			1					
Cedar	22	2.7	3									
Cedar	24	2.0	4									
Yellow pine	18	1.6	5									
Yellow pine	38	2.9	6		2							
Yellow pine	26	2.3	7	1			1					
Yellow pine	27	2.0	8									
Yellow pine	32	2.0	9		1							
Yellow pine	33	2.9	10									
Yellow pine	37	3.0	11									
Cedar	25	2.0	12									
Yellow pine	31	2.7	13	1								
Cedar	22	1.5	14		1							
Yellow pine	36	2.6	15									
Cedar	34	1.8	16			1						

Plot No. 3.

Sugar pine	38	3.0	1	29	15	87	62	33	21	62	120	This area was logged by means of big wheels, so area is pretty well cleaned. Reproduction is in good condition; butts need protection as fire would destroy it entirely.
Yellow pine	30	3.5	2	2								
Yellow pine	28	3.0	8		1		1					
Cedar	36	3.5	12			2						
Sugar pine	58	2.75	14		1							
			28				1					
			32				1					

The results of these tables in comparison with actual seedling counts in virgin timber show that about 75 per cent of all seedlings are destroyed by the present method of logging. Half of this could be avoided by using a little care, particularly in yarding.

Conclusion.

The Hume-Bennett Lumber Company is not practicing forestry on its holdings. The cut is made without reference to the future yield. The diameter limit is too small to leave sufficient seed trees. Restocking to cut-over lands is left to chance.

The entire cut-over area is in a dangerous condition. The slash has been left lying on the ground and a fire burning through this tract would destroy practically all of the second growth. Protection is necessary to insure a future stand of timber. An efficient patrol maintained by the state would insure a fair second crop to future generations. At present, the lands are in a measure protected by the company, but when operations are moved to some other locality this protection will cease, and the area will be left to the mercy of the first fire that may start.

The slash should be piled away from the reproduction and burned each year in the proper season. In this way the danger to the second growth would be greatly lessened. But fire danger can never be entirely removed. Patrol will always be necessary if we are to secure a maximum second crop from our cut-over lands. But the proper disposal of slash will minimize this menace and greatly lessen the intensity of the patrol that would otherwise be needed.

More care should be exercised in logging to save the second growth. Under present conditions, approximately 75 per cent of all the reproduction is destroyed by cutting operations. A large part of this is due mainly to carelessness and could be avoided without increased expense.

SUMMARY.

The area covered in this study consists of 552,303 acres, of which 186,758 acres have been cut over and 365,545 acres are virgin. Ten lumber companies are represented in this acreage. Because of the magnitude of the task and the limited time available, it was impossible to cover all of the private holdings, but these companies were carefully selected to represent all existing conditions in the tracts under operation, exclusive of the redwood belt. It is safe to assume that the conclusion drawn from this study will apply equally well to the entire region. None of the companies are practicing conservative forestry. The cut is being made without regard to increment. Future yield is left largely to chance. No working plans were in use.

Most of the holdings are inadequately protected from fire. Only three companies maintain a paid patrol. Two have not even equipped their engines with spark arresters. Seven companies, or 70 per cent of all those examined, do practically nothing to protect their timber or cut-over lands.

Four companies dispose of their slash. In two cases, it is piled and burned each year. In one, it is burned without piling. The fourth cuts it into four-foot lengths and sells it for cordwood. Reforestation is not being undertaken on a commercial scale. Two companies, whose holdings were not investigated, are doing some experimental planting.

The chief sources of waste are high stumps, breakage in falling, cutting even length logs, and unused tops containing merchantable lumber.

The tracts are being cut so close that most of the present owners will not consider a second crop. Two companies are developing the stock industry on their cut-over lands. These lands present a problem and as yet no definite policy has been formulated for their management.

CONCLUSIONS.

Inasmuch as the properties examined are representative, it is safe to assume that forestry is not practiced on our private lands in California. There is no state control of these lands. No laws compel the companies to log in such a way as to retain the greatest value of the lands for watersheds, or to provide for a future crop of timber in a minimum length of time. No one interest can be greater than the interests of all the State. It is obvious, however, that the lack of conservative forest management will eventually seriously interfere with the maintenance and development of those industries that depend largely upon watersheds or irrigation for their development. Forest destruction has already caused a damage of many millions of dollars, by silting up navigable rivers and reservoirs, by causing an increase of spring floods and a deficiency of water in the summer, and by the drying up of sources of water used for irrigation and for domestic purposes. This damage is already so great as to form one of the principal causes of the demand for forestry. Eventually there must be state control so that each interest may be in a measure subservient to the others. We must not permit an industry that owes its very existence to our natural resources to disappear because of corporate greed. The State should fulfill its responsibility in the matter of aid to the private owners in fire protection and taxes so that it will be possible for them to practice a system of forestry that will at least maintain the minimum of production.

The cut-over lands must be protected from fire so that they may furnish a perpetual yield, and continue to give employment to the large army that are dependent upon the lumber industry. An efficient state patrol, maintained by the State, is the only practical way to secure this protection. An appropriation is necessary to secure such a patrol.

There should be compulsory burning of slash on all cut-over lands. The presence of dry tops, branches and piles of brush in the forest constitutes the greatest menace from fires. The severity of a fire and hence, the damage done, is in direct proportion to the amount of dry litter on the ground. In addition to this, a fire becomes almost impossible to control when burning through dry brush. Burning of slash has been compulsory on our National Forests for years, and the more progressive lumber companies have followed this example. The removal of slash from our forests will greatly lessen the fire menace and consequently minimize the cost of an efficient system of protection.

PLATE X. Close utilization.

This company has very little unnecessary waste. Chute poles are made from inferior species, such as white fir. After logging operations are completed the chute poles are worked up for ties to be used on the logging railroad. Some companies use yellow pine for their chutes and leave the poles in the woods to rot when operations are finished. As a rule not more than one third of the lumber contained in a tree is actually utilized. There is considerable waste in the woods, in the sawmill, in the planing mill, and finally in cutting and fitting for use.

CHAPTER IV.

FOREST TAXATION.

I thoroughly believe that the present methods employed in handling our forests cannot continue indefinitely. Since their preservation, through wise use, is indispensable to our future prosperity, the practice of conservative forestry is inevitable; and timber owners must recognize that they may not handle their timber properties in such a way as to impoverish the whole State, and the State should recognize its responsibility in guarding against such a calamity, not by hysterical legislation but by practical demonstrations and by aiding owners in initiating constructive management. I want to see lumbermen practice forestry because it pays them to do so, not because public sentiment or the legislature may demand it. On the other hand, we shall see the time when timber owners must decide whether the practice of forestry on private lands shall be voluntary or not. There are two problems, however, that must be solved before the application of forestry principles will be practicable; these are forest protection and forest taxation. The latter will be discussed in this chapter.

General Property Tax.

The taxation of forests is governed by the general property tax. This is perhaps the oldest form of taxation and one wholly unadapted to forest investments. The difficulty is not so much with the amount, but with the method of taxation. It is not true that timber and timber lands in California are being excessively or unjustly taxed. There are single cases, perhaps, where taxation is a little excessive, but these are exceptions to prevailing conditions. The general property tax, if strictly enforced in its application to timber properties, would unquestionably result in excessive taxation, but it has not been and is not now being generally enforced. While the valuations of timber lands are higher in a few states (California being among them) than in the rest of the country, yet the general rule still applies. The escape from excessive taxation through lax enforcement of the law offers a gloomy outlook for the future for there is no assurance that the present haphazard easy going methods will continue indefinitely. There must be some guarantee against excessive taxation in the future before private owners can practice forestry and before investors will look favorably upon the reforesting of cut-over areas as profitable investment. The general property tax, in its application to forest investments, should be condemned because it forestalls any effort looking toward the introduction of forestry on private holdings, but not because the owners of such holdings have been bearing more than their just share of the burdens imposed upon them through taxation.

Change in Conditions.

The general property tax worked fairly well in the middle ages because the form of property was a fair index of its ability to pay taxes. It was satisfactory to the early colonists. Their property consisted chiefly of live stock, agricultural implements, visible improvements and primitive household and personal effects. The assessors had little or no difficulty in ascertaining the kind, quality and amount of wealth possessed by each citizen, and it was a simple matter to appraise it at its actual value. There lacked any opportunity for the concealment of wealth and the evasion of taxes.

The economic conditions of to-day have brought about wonderful changes. Our wealth is no longer easy to discover or easy to appraise. Vast sums of intangible property in the form of stocks, bonds and other securities can be easily concealed and escape taxation. Tax evasion is a common practice. For the most part assessments and oaths are fast becoming a farce. Lands and similar visible forms of property are the only forms of wealth that are taxed with some reasonable degree of accuracy. Consequently, timber and farm properties suffer under the general property tax because they are taxed while other forms of wealth escape.

Effects of Taxation.

In an effort to secure more equitable assessments and taxes it is frequently charged that the present system has hastened cutting, increased the waste in logging, prevented the reforesting of cut-over lands for another crop, and retarded the practice of forestry on private lands. According to data compiled by the National Conservation Commission these charges are not sustained by facts. The summary of some 500 replies to inquiries shows that these charges are not well founded. Scattered information from the states of Michigan, Wisconsin, Minnesota, Washington, and California shows that timber owners in those states believe taxation has some influence upon premature cutting, increased waste, and reforesting cut-over land.

Administration.

The administration of the general property tax in California is no better and probably no worse than in other states. County assessors are confronted with a most difficult task and I have no reason for believing other than that each is fulfilling his office to the best of his ability. For the most part they possess no technical skill or facilities for ascertaining the actual values of timber properties. With two exceptions (Lassen and Modoc) they depend upon declarations of taxpayers, hearsay evidence and occasional examinations that are necessarily superficial and inaccurate. Lack of uniformity, over and under valuations and general confusion is necessarily the result.

Out of 38 counties for which data has been compiled, only two have been cruised for assessment purposes; 12 have been roughly classified according to amount and quality of timber; 4 have been examined to some extent by the assessors; 12 examined annually; 2 are examined at irregular periods; and 11 are assessed according to previous valuations. Five counties accept the taxpayer's statement for the classification of timber and cut-over land. Siskiyou County, with nearly 700,000 acres of timber land, and Mendocino County, with over 500,000 acres, are among them.

Since the discussion on taxation of the forests should center on the method rather than the amount, I will only mention the latter. The data is rather amusing, if nothing else. For instance, the timber land in El Dorado County is assessed at a flat rate of $10.00 and cut-over land for $2.00, while the timber land in Siskiyou County is assessed from $6.00 to $7.00 per acre and cut-over land for $1.00. The former has 115,000 acres of timber land and 26,000 acres of cut-over land and the latter has nearly 700,000 and 139,000 acres respectively. Lassen County assesses timber land from $2.50 to $12.50 per acre; Plumas from $8.00 to $12.00, and Shasta from $5.00 to $10.00. The existing inequality of assessed values in the same county, and more noticeably in different counties for similar tracts of timber equally accessible or inaccessible, are unjust to timber owners, and to the county and state alike. While I have the assurance that valuations will be materially advanced in some counties and land now classified as "grazing" will be changed to "timber," it will accomplish but little toward securing a comparative equality. I believe state control offers the only solution.

Investigation Conducted.

During the winter of 1911 and 1912 a study of forest taxation was begun. Agents of the Board of Forestry gathered data from each forested county. The subject was discussed with timber owners and others familiar with and interested in taxes as applied to timber properties.

Special attention was paid to the methods employed in obtaining assessed valuations. Separate values were obtained for timber and logged-off lands. The highest and lowest assessments for each class were recorded. In addition to these data the total amount of timber and cut-over land, assessed as such, was compiled by counties, together with the total area of taxable land.

Alameda County.

There is no timber land in Alameda County. The assessor estimates that from 85 to 90 per cent of the total tax is received from incorporated cities. An actual examination of the land is made annually. In assessing orchard land, the fruit trees are not separated from the land. The assessed value of lands ranges from $4.00 to $600.00 per acre. The assessor estimates that these assessed values represent 60 per cent of the actual value. There are no regular rules for assessing. A raise is expected in assessed values this year. The tax rate in 1911 was $1.34 per $100.00 on land outside the cities. There are no sawmills in the county.

Alpine County.

There is only a small area of timber land in this county (6,033 acres). In assessing, the trees are not separated from the land. No cruises are made. The assessed value of the timber land is $3.00 per acre, and of the farm land $12.00 to $30.00 per acre. The tax rate in 1911 was $2.00 per $100.00. No raise in values is expected. There is one small sawmill in the county. The largest proportion of the total tax is contributed by farming land.

Amador County.

This county has considerable timber land. No cruises are made and the work is not systematized. The trees are not separated from the land. Timber land is assessed at $7.50 per acre, cut-over land at $2.50 to $3.00 per acre, and grazing land at $2.00 to $3.00 per acre. The tax rate on land outside of cities was $2.20 per $100.00 in 1911. The assessor estimates that the assessed value equals about 60 per cent of the actual value. An increase in the assessed values was made in 1911. The assessor is in favor of having the timber cruised.

Butte County.

This county has considerable timber land. An actual examination of the greater part is made annually, and part of the land is cruised by the deputy assessor. The timber land is divided into three classes, the first being assessed at $8.00 to $10.00 per acre, the second at $5.00 to $7.00 per acre, and the third at $2.50 to $6.00 per acre. Cut-over land is assessed at $1.25 to $2.50 per acre. The tax rate in 1911 was $2.30 per $100.00. The average actual value of the timber land was estimated to be about $24.00 per acre. There are no plans for reform in this county and the people are well satisfied with the present method of taxation.

Calaveras County.

There is considerable timber land in this county. The trees are not separated from the land, and no cruises are made. There is some talk of hiring a cruiser, but the county is afraid of the cost. The tax rate was $2.05 per $100.00 in 1911. The assessed value of timber land is $10.00 per acre, of cut-over land $1.25 to $4.00 per acre, and the chaparral land $2.50 to $5.00 per acre. The actual values are estimated at $8.00 to $20.00 per acre.

Contra Costa County.

There is no timber land in this county. The largest proportion of the total county tax is contributed by manufacturing corporations. An actual examination of the land is made annually. In taxing orchard land, the fruit trees are separated from the land. The tax rate was $1.50 per $100.00 in 1911. The average assessed value of the ranch land is estimated to be $35.00 per acre, of chaparral land $3.00 to $6.00 per acre, and of fruit trees $20.00 to $40.00 per acre. The assessor estimates the assessed value to be 60 per cent of the actual value. There are no sawmills in this county.

Del Norte County.

This county has a comparatively large area of timber land. Neither an actual examination nor a cruise of the timber is made. The assessed valuations have been raised about 60 per cent since 1906. In determining assessed values, the trees are not separated from the land. The timber land is assessed at $20.00 to $67.50 per acre, the average assessed value for spruce being $20.00 per acre, and for redwood about $35.00 per acre. It is estimated that 75 to 80 per cent of the total county tax comes from the timber lands. There are no plans of reform. Cut-over land is assessed at $3.00 to $5.00 per acre. The tax rate was $1.75 per $100.00 in 1911.

El Dorado County.

There is considerable timber land in this county. The county has no ownership plats and shows a great lack of system. The trees are not separated from the land. No examinations or cruises are made. The timber land is assessed at $10.00 per acre, which is a great increase over 1910. The cut-over land is assessed at $2.00 per acre and the chaparral land at $2.50 to $5.00 per acre. The tax rate was $2.00 per $100.00 in 1911. The assessor estimates that the assessed value equals 50 to

60 per cent of the actual value. The general sentiment in the county is in favor of securing a better knowledge of the timber resources. There are no sawmills in the county.

Fresno County.

This county has a small area of timber land. No cruises or actual examinations are made of the timber land, and the trees are not separated from the land. The timber is divided into two classes, the first being assessed at $12.50 per acre and the second at $8.00 per acre. The tax rate was $1.64 per $100.00 in 1911. Cut-over and chaparral lands are assessed at $1.50 per acre. The actual value of the timber land was estimated to be about $50.00 per acre. No plans of reform are being discussed, but the assessor is thinking of raising the assessed values.

Glenn County.

This county has a small area of timber land. No cruises are made and the trees are assessed at $2.00, $3.00, $4.00, $5.00, $6.00, $8.00 and $10.00 per acre. Cut-over land is assessed at $2.00 per acre and chaparral land at $2.00 and $3.00 per acre. The assessor estimates that the assessed value represents 60 per cent of the actual value. The tax rate in 1911 was $1.82 and $1.80 per $100.00, depending upon the school district. There was no talk of reform.

Humboldt County.

This county has a large area of timber land. No cruises are made and the trees are not separated from the land. Redwood land is assessed at $15.00 to $60.00 per acre, pine and tanbark oak land at $2.00 to $10.00 per acre. Cut-over land is assessed at $4.00 to $6.00 per acre. The assessor estimates that the assessed value equals about 50 per cent of the actual value, and that about 40 per cent of the total county tax was derived from timber land. The tax rate in 1911 was $1.90 per $100.00. The general sentiment of the county was in favor of cruising if it would not be too expensive.

Inyo County.

There is no timber land in Inyo County. The sagebrush land is valued at about $3.00 per acre and the farm land up to $100.00 per acre. The assessor estimates the assessed value to be about 60 per cent of the actual value. The tax rate in 1911 was $2.00 per $100.00. There are no sawmills in the county.

Kern County.

There is very little timber land in Kern county, and what is found is assessed at $1.33 per acre. Cut-over land is assessed at $2.00 to $12.00 per acre. The actual value of the timber land was estimated to be $2.75 to $3.00 per acre. No cruises were made. The tax rate in 1911 was $1.20 per $100.00. There is one sawmill in Kern County.

Kings County.

Kings County has no timber land. The grazing land is assessed at $2.50 per acre. The principal revenue of the county comes from the fruit lands. The fruit trees are assessed separately. Fruit and farm land is assessed at $40.00 to $100.00 per acre. The tax rate in 1911 was $1.65 per $100.00. There are no sawmill in the county.

Lake County.

This county is mostly agricultural and has very little timber land. No examinations and no cruises are made of the timber and the trees are not assessed separately. Timber land is assessed at $3.00 to $4.00 per acre, cut-over land at $2.00 to $2.50 per acre and chaparral land at $1.25 per acre. The tax rate in 1911 was $2.15 per $100.00. It was estimated that the timber land was actually worth $7.00 to $9.00 per acre. The assessor contemplates raising all the assessed values in the county.

Lassen County.

This county has a large area of timber land. In 1905, this was cruised and classified by an expert cruiser. The timber land was divided into four classes, class A being assessed at $12.50 per acre, class B at $7.50 per acre, class C at

$5.00 per acre, and class D at $2.50 per acre. The cut-over land is assessed at $2.00 per acre and the chaparral at $2.00 to $3.00 per acre. The assessor estimates that the assessed values represent about 30 per cent of the actual value. The timber land is recorded on separate plats. It was estimated that about 25 per cent of the total county tax was derived from the timber land. The assessor is contemplating raising the assessed values of the timber land. There was a flat rate of $2.50 per acre on the timber land in Lassen County previous to the cruise.

Los Angeles County.

There is no timber land in this county. In 1911 the tax rate was $1.20 per $100.00. The assessor estimated that the assessed values represent 25 to 40 per cent of the actual values. The fruit trees are assessed separately. There are no sawmills in the county. Chaparral land is assessed at $8.00 to $100.00 per acre, and fruit land up to $600.00 per acre.

Madera County.

This county has a rather small area of timber land. No cruises are made and the trees are not separated from the land. In 1911 the tax rate was $2.30 per $100.00. The assessed value of timber land was $10.00 per acre (will be $15.00 in 1912), of cut-over land was $1.50 per acre (will be $2.50 in 1912), and of chaparral $1.50 per acre. The assessor estimated that the assessed value represented about 50 per cent of the actual value.

Marin County.

The timbered area in this county is small. There are no sawmills in the county. Cruises are not made and the trees are not separated. In 1911 the tax rate was $1.55 per $100.00. The assessed value of timber land was about $9.00 per acre and for cut-over land about the same. No plans of reform were being discussed.

Mariposa County.

There is considerable timber land in this county. No cruises are made, but examinations are made at irregular intervals. The trees are not assessed separately. The timber land is divided into two classes for assessment purposes, the first being assessed at $25.00 per acre and the second at $12.50 per acre. Cut-over land is assessed at $3.50 per acre and chaparral at $3.50 to $4.00 per acre. In 1911, the tax rate was $1.70 per $100.00. It was estimated that the actual value of the timber land was about $50.00 per acre. The assessed values were raised in 1911. The assessor estimated that 25 per cent of the total county tax was derived from timber land. There were no plans of reform in this county.

Mendocino County.

The timbered area in Mendocino County is very large. No cruises and no actual examinations are made and the trees are not assessed separately. The timber land is assessed at about $10.00 per acre, the chaparral land at $2.50 per acre and the cut-over land at $2.50 per acre. In 1911 the tax rate was $2.14 per $100.00. It was estimated that the actual value of the timber land ranged from $10.00 to $100.00 per acre. No change has been made in the assessed values for nearly ten years. The timber lands probably contribute about 50 per cent of the total county tax. The general sentiment is in favor of raising the assessed values.

Merced County.

There is no timber land in Merced County. Grazing land is assessed at $4.00 per acre, and farm land at $10.00 to $100.00 per acre, and chaparral land at $1.25 to $2.50 per acre. In 1911 the tax rate was $2.15 per $100.00. There are no sawmills in the county.

Modoc County.

There is a large area of timber land in this county. A cruise of the timber was made by the county surveyor in 1908 and 1909; it was divided, for assessment purposes, into three classes. Class A is assessed at $12.00 per acre, class B at $8.50 per acre, and class C at $5.00 per acre. Cut-over land is assessed at $2.00 to $2.50 per acre. The timber lands are recorded in a separate plat book, showing the class in which each subdivision belongs. Before this cruise was made, there was a flat rate of $2.50 per acre on all timber land. It was estimated that the actual value of the timber land is from $10.00 to $50.00 per acre. The assessor estimated that about 33 per cent of the total county tax is derived from the timber land. In 1911, the tax rate was $1.60 per $100.00. The people of the county are well satisfied with the present system of taxation.

Mono County.

The timbered area in this county is small. No cruises are made and the trees are not assessed separately. Examinations are made very irregularly. The timber land is assessed at $2.50 to $3.00 per acre and the cut-over land at $1.50 to $2.00 per acre. The tax rate was $2.00 per $100.00 in 1911. The largest proportion of the county tax is derived from the grazing and farm land. The supervisors do not favor an increase in assessed values.

Monterey County.

This county has a rather small area of timber land. No cruises are made and the trees are not assessed separately. No actual examinations are made and there is a great lack of system in assessing the timber land. The timber, cut-over and chaparral lands are all assessed as grazing land at $1.25 to $4.00 per acre. The assessor estimated that the assessed values represented 45 per cent of the actual value. Fruit land is assessed at $15.00 to $225.00 per acre. There are no sawmills in the county.

Napa County.

There is no timber land in this county. The principal tax revenue comes from the ranch land. The fruit trees are not assessed separately. Examinations of the lands are made annually. Ranch and fruit land is assessed at $25.00 to $300.00 per acre, and chaparral land, which is used for grazing, at $2.00 to $5.00 per acre. The assessor estimated that the assessed value represents 50 to 60 per cent of the actual value. The tax rate was $1.76 per $100.00 in 1911. There are no sawmills in the county.

Nevada County.

The timbered area is rather small. No cruises are made and examinations are only made at irregular intervals. The trees are not assessed separately. Timber land is assessed at $2.00 to $5.00 per acre, cut-over land at $1.00 per acre, and chaparral, which is used for grazing, up to $10.00 per acre. The assessor estimates that this represents about 60 per cent of the actual value. The tax rate in 1911 was $2.50 per $100.00. There were no plans for reform.

Orange County.

There is very little timber land in this county. The trees are assessed separately. The tax rate was $1.50 per $100.00 in 1911. The principal revenue comes from the orange and walnut groves. Timber land is assessed at $17.68 per acre, and the trees at $23.32 per acre. Fruit land is assessed at $25.00 to $225.00 per acre and the fruit trees at $50.00 to $225.00 per acre. Grazing land is assessed at about $5.00 per acre. The assessor estimates that the assessed value represents 30 per cent of the actual value. There are no sawmills in the county.

Placer County.

This county has a large area of timber land. No examinations are made, but the trees are assessed separately. The timber land is assessed at a flat rate of $1.00 per acre and the trees are assessed $3.00, $4.00 or $5.00 in addition. Cut-over land is assessed at $1.00 per acre and chaparral or grazing land at $4.00 to $10.00 per acre. It was estimated that the actual value of the timber land was $20.00 to $30.00 per acre. About 15 per cent of the total county tax is derived from the timber land. In 1911, the tax rate was $2.25 per $100.00. The assessor favors cruising, but the board of supervisors voted against this proposition.

Plumas County.

There is a large area of timber land in this county. No examination and no cruises are made, but the valuations are raised from year to year. The timber land is assessed at $8.00, $10.00 and $12.00 per acre, chaparral land at $2.00 to $2.50 per acre, and cut-over land at $2.00 per acre. The tax rate in 1911 varied from $1.65 to

$2.80 per $100.00, depending upon the school district. The actual value of the timber land ranges from about $20.00 to $50.00 per acre. The assessor estimated that 65 per cent of the total tax was derived from timber land, 2 per cent from chaparral land, and about 1 per cent from the cut-over land. The present system is unsatisfactory and cruising the timber is being advocated.

Riverside County.

The timbered area in this county is small. The principal tax revenue comes from the fruit land. A four year old grove is assessed at $60.00 per acre and this is increased $30.00 per acre annually until $225.00 per acre is reached. The land and water rights are assessed separately, and the maximum valuation for the three is $500.00 per acre. The tax rate was $2.10 per $100.00 in 1911, exclusive of bonded school tax. Timber and grazing land are not separated and no examination of them is made. The assessor estimated that the assessed values represent about 30 per cent of the actual value. The present methods of taxation are unsatisfactory.

Sacramento County.

There is no timber or cut-over land in this county. An actual examination of all the land is made annually. Regular rules for assessing are in vogue. The tax rate was $1.69 per $100.00 in 1911, on land outside of cities. The assessor estimates that the assessed values represent 60 per cent of the actual value. Grazing land is assessed at $5.00 per acre, fruit and ranch lands at $15.00 to $500.00 per acre, and dredging land at $150.00 to $750.00 per acre. No plans of reform are being discussed. There are no sawmills in the county.

San Benito County.

There is very little timber land, but a great area of chaparral land in this county. In 1911, the tax rate was $1.70 per $100.00. Chaparral land is assessed at $1.00 to $2.50 per acre, cut-over land at $1.50 per acre, fruit land at $120.00 per acre, and fruit trees at $50.00 per acre. No actual examinations are made. The assessor estimates that the assessed value represents 45 per cent of the actual value. There are no sawmills in this county.

San Bernardino County.

The timbered area in this county is small, and the fruit land is the principal source of revenue. No cruises are made, but the values are raised annually to allow for growth. Timber land is assessed at $2.25 to $7.50 per acre, cut-over land at $2.00 to $3.00 per acre, fruit land at $100.00 to $350.00 per acre and fruit trees at $20.00 to $200.00 per acre. The assessor estimates that the assessed values represent 30 per cent of the actual value. The general sentiment is that the tax rate is too high and plans for reform are being discussed. In 1911 the tax rate was $2.50 per $100.00.

San Diego County.

This county has a small area of timber land, but the principal revenue comes from the fruit land. The tax rate was $2.00 per $100.00 in 1911. The forest trees are not assessed separately. The timber land is assessed at about $1.50 per acre, chaparral land at $3.00 to $5.00 per acre and fruit trees at 30 cents per tree. The assessor estimates the assessed value to be 30 per cent of the actual value. There is one small sawmill in the county.

San Joaquin County.

There is no timber land in this county, and the greater part of the revenue is contributed by the farm land. Ranch land is assessed at $10.00 to $300.000 and up to $1,000.00 per acre, in a few cases. Grazing or chaparral land is assessed at about $3.00 per acre. The assessor estimates the assessed values to be about 50 per cent of the actual value. There are no sawmills in the county.

San Luis Obispo County.

There is very little timber in this county. Apple and walnut lands are assessed at about $200.00 per acre for walnut land and $6.00 to $8.00 per acre for apple land. The assessor estimates the assessed values to be 25 per cent of the actual value. The tax rate in 1911 was $2.11 per $100.00. Chaparral and oak land is classified as grazing land and assessed $1.25 per acre. There are no plans for reform and no sawmills in the county.

San Mateo County.

There is a small area of timber land in this county. No cruises and no examinations are made. Timber land is assessed at $8.00 to $12.00 per acre, cut-over land at $2.00 to $5.00 per acre, and chaparral land at $2.00 to $50.00 per acre. The tax rate in 1911 was $1.85 per $100.00. No plans of reform were being discussed. There are four sawmills in the county.

Santa Barbara County.

There is no timber in this county, but there is a big area of chaparral land, which is assessed at $1.25 and $1.30 per acre. The tax rate was $2.34 and $2.74 per $100.00 in 1911. The general sentiment is that the present system is satisfactory.

Santa Clara County.

There is no timber land, but a great deal of chaparral land in this county which is assessed at $1.50 to $5.00 and up to $10.00 per acre in some cases. The tax rate in 1911 was $1.35 per $100.00. There are no sawmills in this county and no plans for reform.

Santa Cruz County

Two thirds of the timber land in this county has been cut over and is now considered as chaparral land. In 1911 the tax rate was $2.10 per $100.00. Chaparral land is assessed at $2.00 to $5.00 per acre, cut-over land at $5.00 to $8.00 per acre, timber land at $10.00 to $50.00 per acre, fruit land $50.00 to $200.00 per acre, and 25 cents to $1.75 each for fruit trees. The assessor estimates that the assessed value represents about 45 per cent of the actual value. No examinations and no cruises are made. The general opinion is that the assessed values of the timber land are too high. There are four sawmills in the county.

Shasta County.

There is a large area of timber land in this county. Examinations are made at irregular intervals and some cruising is done. The trees are not assessed separately. The timber land is divided into four classes which are assessed as follows: Class 1 at $10.00 per acre; class 2 at $8.00 per acre; class 3 at $5.00 per acre and class 4 which is cut-over land, at 50 cents to $2.00 per acre. Chaparral land is assessed at $1.25 to $2.50 per acre. It was estimated that 25 per cent of the total county tax is derived from the timber land and 8 to 10 per cent from the chaparral and grazing land. The actual value of the timber land ranges from about $16.00 to $60.00 per acre. The tax rate was $2.24 per $100.00 in 1911. The assessor is in favor of cruising the timber.

Sierra County.

The area of timber land in this county is large. No cruises are made and actual examinations are only made in case of doubt. The trees are not assessed separately. Timber land is assessed at $2.50 to $6.00 per acre and cut-over land at $1.00 per acre. Proportional reductions are made when part of an area is cut over. The tax rate was $2.00 per $100.00 in 1911. It was estimated that the average actual value of the timber land is about $25.00 per acre and of the cut-over land about $2.50 per acre. No plans for reform were being discussed.

Siskiyou County.

There is a very large area of timber land in this county. The trees are not assessed separately and neither cruises nor actual examinations are made. Timber land is assessed according to accessibility at $6.00 and $7.00 per acre, and cut-over land at $1.00 per acre. In 1911 the tax rate was $2.00 per $100.00. It was estimated that 65 per cent of the total tax is derived from timber land, 15 per cent from chaparral, desert and grazing land, and 5 per cent from the cut-over land. Chaparral land is assessed at $2.50 per acre. The general sentiment favors cruising. There are fifty-two sawmills in this county.

Solano County.

There is no timber land in this county. The principal tax revenue comes from the fruit and ranch land. An actual examination is made each year. The tax rate in 1911 was $1.60 per $100.00. Land is assessed at $10.00 to $300.00 per acre, and fruit trees at $40.00 per acre. The assessor estimated that the assessed values represent 60 to 70 per cent of the actual values. There are no sawmills in the county and no plans for reform.

Sonoma County.

There is a large area of timber land in this county. No cruises are made and the trees are not assessed separately. An actual examination is made every four years. The oak land is assessed at $3.00 per acre, redwood at $8.00 to $50.00 per acre, cut-over land at $4.00 to $5.00 per acre and chaparral at $2.00 per acre. The assessor estimates that the assessed values represent 30 to 50 per cent of the actual value, and believes this to be high enough. In 1911 the tax rate was $1.60 per $100.00. The principal revenue in this county comes from farm land.

Stanislaus County.

There is no timber land in this county; also there are no sawmills. The principal tax revenue comes from ranch land. The tax rate was $1.85 per $100.00 in 1911.

Sutter County.

There is no timber land in this county; also no sawmills. Examinations of the land are made yearly. Pasture land is assessed at $2.50 to $10.00 per acre. The tax rate in 1911 was $1.50 per $100.00. The present system of taxation is satisfactory to the people.

Tehama County.

This county has a large area of timber land. No cruises nor examinations are made and the trees are not assessed separately. The timber land is divided into four classes, which are assessed as follows: Class 1 at $3.00 per acre, class 2 at $5.00 per acre, class 3 at $8.00 per acre and class 4 at $10.00 per acre. Cut-over land is assessed at 50 cents to $2.00 per acre, and chaparral at $1.50 to $2.50 per acre. The average actual value of the timber land is estimated to be about $19.00 per acre. The people seem fairly satisfied with the present methods, but the general sentiment favors cruising.

Trinity County.

This county has a large area of timber land. No cruises and no examinations are made. The trees are not assessed separately. Timber land is assessed at $5.00, $8.00 and $10.00 per acre, very poor timber land is assessed at $2.50 and $3.00 per acre, cut-over land at $1.00 per acre and chaparral at $1.00 to $1.50 per acre. The actual value of the timber land is estimated to be from $10.00 to $20.00 per acre. In 1911 the tax rate was $2.60 per $100.00. The assessor estimates that the timber land contributes 50 per cent and the chaparral land 10 per cent of the total tax. The general sentiment of the county is in favor of cruising.

Tulare County.

This county has a rather large area of timber land. The trees are not assessed separately. No examinations and no cruises are made. Timber land is assessed at $2.50 to $30.00 per acre, cut-over land at $1.50 per acre and grazing and chaparral land at $2.50 per acre. The assessor estimates the assessed values to be about 50 per cent of the actual value. The tax rate was $1.70 per $100.00 in 1911. There were no plans for reform.

Tuolumne County.

There is a rather large area of timber land in this county. No cruises or examinations are made. The trees are not assessed separately. Ordinary timber land is assessed at $10.00 per acre, "Big Tree" tracts at $80.00 per acre, cut-over land at $2.00 per acre and chaparral land at $1.25 to $3.25 per acre. The actual value of the ordinary timber land is estimated to be about $18.00 per acre. The tax rate in 1911 was $1.95 per $100.00. There were no plans for reform.

Ventura County.

There is very little timber land in this county. Most of the revenue comes from the fruit lands. Fruit land is assessed at $250.00 to $300.00 per acre, and fruit trees at $1.00, $2.00 and up to $4.00 each. The tax rate in 1911 was $1.70 per $100.00. The timber is only used locally and there is no systematic method for determining the valuation of timber land.

Yuba County.

This county has considerable timber land. No cruise and no examinations are made, but the assessed values are determined by the general knowledge of the assessor. Timber land is assessed at $5.00 per acre, cut-over land at $2.00 per acre, and chaparral and grazing land at $2.00 per acre. The tax rate in 1911 was $2.40 per $100.00. There were no plans for reform.

It is apparent that satisfactory and uniform assessed values of timber properties can not be secured by the methods now employed. It is unjust — viewed alike by owners and counties. While timber cruising is expensive, it is nevertheless the only way to determine the amount of timber on different holdings, which is the principal factor, other things being equal, in arriving at equitable values.

In some of the timbered counties the revenue derived from forest taxes forms a large percentage, and frequently the timbered area exceeds 25 per cent of the assessable land area. The estimated percentage of assessed value to true value is often very low; whether it is lower in proportion to ranch and range land remains to be determined.

A summary of the data obtained for the several counties is shown in the following table:

TIMBER AREA AND ASSESSED VALUATION.

County.	County assessors' methods for determining valuation of timbered and cut-over lands.	Assessed valuation per acre.				Estimated per-cent of true value.	Forest land privately owned.		Taxable land.			Estimated per cent of county tax derived from timber lands.	Tax rate per $100.00, 1911.
		Timber land.		Cut-over land.									
		Lowest.	Highest.	Lowest.	Highest.		Timbered acres.	Cut-over acres.	Total area acres.	Per cent timbered.	Per cent cut-over.

Letters from Lumbermen.

During the winter of 1911-1912 the following questions, among others, were sent to representative lumbermen throughout the State:

1. Do you consider the present tax on timber lands excessive?
2. Would you suggest reform; if so, of what description?
3. Would you consider it feasible, for purposes of taxation, to separate the land from the timber, taxing the first annually, and the latter when cut?

Thirty-three replies were received, giving some valuable testimony as to how the lumbermen of this State regard the present system of taxation of forest land.

The answers to the first question may be classified as follows:

Answers to question 1.	
1. No information	17
2. Present tax believed to be excessive	5
3. Present tax not considered excessive	11
Total	33

Some interesting reasons were given as to why the present tax was considered excessive:

Case 1. Considered it fair as compared with what other taxpayers have to pay, but believed there is a chance for more economy in public expenditures.

Case 2. Believed the tax to be excessive for the reason that the crop is harvested but once, and the increase in stumpage has not been sufficient to take care of the increased taxes and the interest on the investment.

Case 3. Considered that taxes are growing much faster than timber values.

Case 4. Considered it excessive on the grounds that the timbered portion is inaccessible in his locality, and the cut portion unsalable and the whole unproductive, and a bill of expense for twenty years.

Case 5. Believed the tax to be excessive for the reason that the land has only a nominal value and is assessed at a proportionately higher rate than other property in the same county.

No reasons were given as to why the present tax was not considered excessive, but one lumberman qualified his reply with the remark that while he did not consider the tax excessive, he did not feel justified in buying more timber lands because of it.

The replies to question 2 may be classified as follows:

Answers to question 2.	
No information	19
No reform suggested	5
Favor reform, but have no definite suggestions	1
Have definite plans for reform	8
Total	33

In the replies in which no reform was suggested, no reasons were given by most, while a few expressed themselves as satisfied with the present system. One lumberman was opposed to reform because he believed that conditions will adjust themselves to almost any system of taxation in time. He stated that he is opposed to continual changing.

The following are a few of the plans for reform that were advanced by the lumbermen in their replies:

Case 1. Several expressed themselves as being in favor of either carrying the cut-over land that will reforest itself at a nominal valuation, or else to eliminate it from taxation entirely.

Case 2. Standing timber should not be taxed at all, as it encourages enormous waste.

Case 3. To increase the tax on manufactured lumber and reduce it on standing timber.

Case 4. A uniform taxation for all counties in the State, based upon character and quality of timber and accessibility to transportation, and the assessment of absentee owners on the same basis as resident owners.

Case 5. One lumberman, who has made an exhaustive study of forest taxation, writes that in his opinion the best and most satisfactory system of taxing our forests will be to assess them when the timber is cut. He states that under the present tax laws it is quite impossible to carry on reforestation successfully on an economical basis.

Case 6. Sent by one of the lumbermen's associations. The State should establish a sort of revolving fund, entirely exempting timber lands, after proper classification, from taxation, but heavily taxing the product when it is cut and before it is removed from the land. These receipts from the lumbering operations are to be made into a fund in charge of the State, to be distributed annually among the timber counties according to their needs, crediting the counties with the money they have paid in and charging them with that paid to them, with the idea that in the long run matters will be evened up. It is their idea that such a method would encourage reforestation.

The answers to question 3 may be classified as follows:

Answers to question 3.	
No information	17
Considered feasible	6
Not considered feasible	10
Total	33

Two reasons were advanced as to why this plan was considered feasible. One was that this method would tend greatly to the conservation of timber, and the other was that by this method the taxes might be made equitable and just.

Of those who did not consider this plan feasible, Case 1 believed that a low value, placed on the land and timber together, would be preferable, for the reason that it would give a revenue to the county in which the timber land was located. Case 2 thought that standing timber should be taxed with its land and not separated. Case 3 did not believe it feasible for the reason that the land alone is worth practically nothing, while it is worth $100.00 to $150.00 per acre with its timber.

Conclusions.

It is obvious from these replies that the views expressed by the timbermen are far from being uniform. Many of them have given very little thought to the subject of forest taxation, and consequently were unable to give any expressions of opinion. The larger holders, however, have given a great deal of study to this taxation problem and many definite plans for reform were presented. The majority of these men were unanimous in declaring that the present system of taxation is unsatisfactory and that some reform is needed. While, in many cases, the present taxes were not considered excessive, the lack of uniformity and the uncertainty under the present system that the future taxes would not be made excessive were regarded as being prohibitive against the growing of future crops. No man will engage in such a long-time investment without some knowledge of what his expenses are to be, for nothing deters an investor so much as uncertainty of the costs. Moreover, he may pay taxes for forty or fifty years, only to see his entire holdings wiped out by fire with the result that his investment is a total loss.

Taxation in Other States.

Inquiries were made of secretaries of states, state foresters and forest schools throughout the country in order to find out what the other states are doing in regard to the taxation of timber lands. In all, 62 replies were received.

The results of these inquries may be classified as follows:

1. Number of states that have made no study of forest taxation	19
2. Number of states that have made a study of forest taxation	17
3. Number of states that contemplate making such a study	4
4. Number of states that have legislation concerning forest taxation	15

Forest Tax Laws.

The forest tax laws passed by other states may be put into three general classes: 1st, bounties; 2d, rebates; and 3d, exemption of a part or all of the area held by an owner for a period of years.

(1) *Bounties.*

Minnesota, Kansas, Massachusetts, Wyoming, Wisconsin, and Illinois are the States in which bounties are offered. These bounties are either in the form of competitive prizes for the best plantations or they are paid for each acre which is planted according to the provisions of the State.

So far as can be ascertained, Minnesota is the only State that has secured any results by this method. It has been estimated that 50,000 acres have been planted under this law, in Minnesota, at a cost of $440,000. It is obvious that this cost will be prohibitive when applied to the great areas of cut-over lands such as we have in California.

The Wyoming law is given in full below as a type of bounty law.

Wyoming Revised Statutes.

> Section 2645. It shall be lawful for the board of county commissioners in any county in this State to offer a bounty to any person in said county who shall hereafter plant one or more acres of land with forest trees and properly cultivate the same for five years for each acre so planted and cultivated; *provided*, that trees so planted shall not be at a greater distance than ten feet apart each way and shall be kept in a live, thrifty condition for at least five years after being planted before said bounty shall be due and payable; *and provided, further*, that the provisions of this act shall not apply to any lands held as timber culture entries under any of the timber laws of the United States.
>
> Section 2646. The board of county commissioners desiring to offer the bounty herein provided for, shall do so by resolution to be made of record and giving notice in some newspaper published in the county three weeks prior to the first day of April of each year, said resolution and notice to state the amount of bounty offered for each acre planted and cultivated.
>
> Section 2647. Any person claiming the bounty under this chapter shall make proof before the county commissioners that he has complied with the provisions of section 2645, and that the trees planted by him are in a healthy and growing condition.
>
> Section 2648. Upon satisfactory proof of the compliance with this chapter, the board of county commissioners may issue to the person entitled thereto a warrant upon the county treasurer as in other cases, for the amount due under the offer made by the board.

(2) *Rebates.*

Pennsylvania and New Hampshire have tried offering rebates of a portion of the taxes. Their method consists of assessing timber lands at their sale value, but offering under certain restrictions, a rebate upon taxes paid. In New Hampshire, the law has only been in force since 1903, and enough time has not elapsed for a thorough trial. However, very few have availed themselves of the privileges, thus far. This method has been in force in Pennsylvania for over twenty years, but with very little result, and in 1905 the laws were redrafted and reënacted. The Pennsylvania laws, as reënacted, are given below, although their value cannot be said to be fully determined.

ACT NO. 88.

To encourage the preservation of forests, by providing for a rebate of taxes levied upon forested land.

SECTION 1. *Be it enacted, etc.* That in consideration of the public benefit to be derived from the retention of forest or timber trees, the owner or owners of land in this commonwealth, having on it forest or timber trees averaging not fewer than fifty trees to the acre, each of the said trees to measure at least eight inches in diameter, at a height six feet above the surface of the ground, with no portion of the said land absolutely cleared of the said trees, shall, upon filing with the assessors of their respective townships or districts, annually, an affidavit made by some one in his, her or their behalf, upon blanks to be provided by the county commissioners of the respective counties, and by them to be furnished to the assessors for the purposes herein intended, setting forth the number of acres of timber land within the requirements of this act, be entitled to receive annually, during the period that the said trees are maintained in good condition upon the said land, a rebate equal to eighty per centum of all taxes, local and county, annually assessed and paid upon said lands or so much of the eighty per centum as shall not exceed in all the sum of forty-five cents per acre; the said rebate to be deducted from said taxes pro rata, and receipted for by the respective tax collectors or county treasurers; *provided, however*, that no one property owner shall be entitled to receive said rebate on more than fifty acres.

SEC. 2. It shall be the duty of the assessor, when such affidavit is filed with him, to record upon his assessment book the amount of timber land upon which the owner or owners may be entitled to receive the rebate, together with the value at which such timber land shall be assessed, for the purpose of furnishing the necessary information to those who shall prepare the respective tax duplicates, and upon which duplicate the amount of the said rebate shall be stated. No additional compensation shall be allowed any assessor for performing the duties required by this act. It shall likewise be the duty of each assessor, after receiving such affidavit, to file the same, with the county commissioners of the respective counties.

SEC. 3. The following acts of assembly, to wit: "An act for the preservation of forests, and partially relieving forest lands from taxation," approved May twenty-five, one thousand eight hundred and ninety-seven (Pamphlet Laws, 77), and all other acts or parts of acts inconsistent with the subject matter covered by this act, be and the same are hereby repealed.

Approved the eighth day of April, A. D. 1905.

ACT NO. 179.

To encourage the planting and the maintaining of sprout forest and timber trees, and providing that those who thus aid shall be exempt from taxation; defining the duties of the township assessor of taxes and penalties for violation of this act.

SECTION 1. *Be it enacted, etc.* That in consideration of the public benefit to be derived from the planting and cultivation of forest or timber trees, the owner or owners of any land in this commonwealth who shall plant the same with forest or timber trees, in number not less than three hundred to the acre, shall have a rebate in his, or her, or its taxes, to the amount of eighty per centum thereof, thereon, for a period of thirty-five years; *provided*, that such rebate shall not amount to more than forty-five cents per acre, said period of exemption to be counted from the time the said land or lands shall have been planted with forest or timber trees, as aforesaid, or from the time it may have been necessary to replant the same, as aforesaid, by reason of destruction from fire; and the rebate herein provided for shall be calculated and allowed by the tax collector.

SEC. 2. The owner or owners of any land or lands in this commonwealth who shall maintain upon said land or lands sprout forest or timber trees, in number not less than three hundred to an acre, shall be entitled to and receive the rebate of taxes as provided in section one; said period of exemption to be counted from the time the said land or lands shall have been so maintained with sprout forest or timber trees, or from the time that said sprout forest or timber trees may have been destroyed by fire.

SEC. 3. Upon any tract or tracts selected as a forest reservation, in accordance with sections one and two of this act, which contain fifty or less original forest trees on each acre, the owner or owners may plant a sufficient number of trees which shall make up not less than the required three hundred trees to the acre, and the same become subject to this act, in accordance with sections one and two.

SEC. 4. No land owner or owners shall receive the benefit of this act who shall permit cattle, horses, sheep, hogs, or goats to pasture upon such reservation or reservations, until at least two hundred trees upon each acre of said tract are four or more inches in diameter two feet from the surface of the ground.

SEC. 5. It shall be the duty of the township assessor of taxes to personally examine the various forest reservations, and, if found necessary, to demand of the owner or owners, or their agent thereof, to subscribe, under oath, that the land is maintained under the conditions of this act; and to return to the county commissioners the number of acres so maintained and the time from which the land has been so maintained; and also to make a duplicate return of the same data to the state forestry commission.

SEC. 6. Any assessor who shall knowingly and wilfully accept and make a fraudulent return or any owner or agent who shall knowingly and wilfully make any fraudulent return to the assessor, shall be liable to a fine of not more than five hundred dollars, or imprisonment of not more than one year, or either or both, at the discretion of the court; *provided, however*, that the provisions of this act shall not be construed so as to exempt from taxation more than five hundred acres, owned by any one person or body corporate, or limited copartnership or association.

All acts inconsistent with this act are hereby repealed.

Approved the twentieth day of April, A. D. 1905.

(3) *Exemption.*

Colorado, Connecticut, Indiana, Maine, Massachusetts, Nebraska, New Hampshire, Rhode Island, Vermont, and Wisconsin have laws which exempt a portion or all of young forest plantations for a period of years. Almost no results have been reported from these laws. This is probably due in part to certain very important defects in these laws.

The restriction of this exemption to plantations, and in several States, to land other than woodland, in a large measure destroys its usefulness at the very beginning. To give good results, these laws must be drawn so as to include young stands produced by natural reproduction. In several of the States, the number of trees required per acre is too large, while the number of species permitted is too small. Often, the proper care of the trees and the most profitable management of the stand is interfered with by the requirements of the law.

The period of the tax abatement is not long enough to make the financial consideration sufficient to act as much of an inducement to the owner. It generally comes at a time when the plantation has little value, and the remission of taxes is small when compared to the expenses involved in preparing the land and planting the trees. By the time the trees are large enough to have any real value the period of tax exemption has elapsed and the land and trees are again subject to the general property tax.

The framers of these laws have placed the whole burden of the tax redemption upon the particular locality in which the plantation is located. The advantages from these plantations are derived by the State in general, but under these laws, whatever is gained by the timber owner must be made up by heavier assessments upon the other local owners.

The Rhode Island law, as amended in 1908, is hereby given below as a type of exemption law.

Chapter 1581, Laws of 1908.

An act in amendment of section 3 of chapter 44 of the General Laws, entitled "Of Property Liable to and Exempt from Taxation."

It is enacted by the general assembly as follows:

SECTION 1. Section 3 of Chapter 44 of the General Laws is hereby amended so as to read as follows:

"Section 3. Whenever there shall have been planted one or more acres of land worth not more than twenty-five dollars per acre in the State, to trees of any of the following kinds: chestnut, hickory, oak, maple, larch, pine, ash, catalpa, locust, basswood, beech, hemlock, spruce, tulip tree, cedar, sycamore and walnut in numbers not less than five hundred to the acre, the owner of such plantation of trees may file with the tax assessors in any town in which such plantation may be located an affidavit showing that he has complied with the requirements of this act.

"Upon such proof, such plantation, including the trees and land on which they are growing in good condition, shall be exempted from all taxation whatsoever for a period of fifteen years, said period of exemption to be counted from the time the said land shall have been planted as aforesaid, or from the time it may have been necessary to replant the same, by reason of destruction by fire, if the same shall be replanted within one year after such destruction; *provided*, said land is planted or replanted, as the case may be, and managed under a forest working plan approved by the state commissioner of forestry during said period of exemption from taxation; *provided, further*, that the provisions of this act shall not be construed so as to exempt from taxation more than three hundred acres owned by any one person, corporation, limited copartnership, or association."

SEC. 2. This act shall take effect upon its passage, and all acts and parts of acts inconsistent herewith are hereby repealed.

Legislation.

It seems apparent from the foregoing that laws providing for rebates, bounties, prizes or exemptions have accomplished but little toward the practice of forestry. They all fail in that they do not provide for a different method of taxing forest properties. Legislation in our own State should be carefully thought out and planned with a view of making it possible to grow crop after crop of timber. Much study of this problem is necessary before proper legislation can be suggested. Those who have devoted much attention to forest taxation are of the opinion that the forests should be taxed when they are cut: when they yield a revenue with which to pay. No such laws have been passed by any State, consequently no assistance, based upon the operation of such a law, can be secured.

A systematic study of the taxation problem should be continued. If, during the investigation, it is found that timber is being cut because the present owners have not sufficient capital to pay the taxes, then an emergency measure might very properly be passed to cover such cases. Deferred tax certificates, bearing 6 per cent interest, could be issued to the owner by the county assessor upon application. Any legal subdivision could be released for cutting, by giving thirty days' notice, after the interest and accrued taxes have been paid. This plan has been suggested by Mr. George M. Cornwall, editor of *The Timberman*. Mr. Cornwall has done much toward furthering the cause of forestry and his plan seems adapted to practical application.

CHAPTER V.

STATE FORESTRY DEPARTMENTS.

ORGANIZATION AND APPROPRIATIONS.

That the legislators, and the public generally, may be fully informed of what other States are doing to conserve and preserve their timber resources, an investigation has been made of the organization and appropriations of such States as are practicing forestry. In some States a good beginning has been made, and an adequate working capital has been provided.

An effort has been made to keep the forestry departments as free from political influences as possible. Every phase of this great movement is new; the work is both investigative and creative and its ultimate success depends largely upon the officers' familiarity with forest conditions in his State. The problems are as intricate as they are numerous. Much time is required to gain a thorough working knowledge of field conditions and of the problems affecting different interests and localities. Frequent changes in administration are detrimental to the solution of problems that oftentimes require years of patient study and observation.

Twenty-two States and one territory have recognized the importance of forestry. The tendency is to improve the stronger ones and to strengthen the weaker ones by better legislation and increased appropriations.

Massachusetts spends $295,000 annually for the protection, extension, and solution of her forest problems, but her timbered area is only 2,000,000 acres.

New York spends $266,800 and her forested area is 12,000,000 acres.

Pennsylvania has a forested area of 9,200,000 acres and spends $280,250 annually.

Wisconsin with her 16,000,000 acres of forested lands spends $137,100 annually.

And what does California appropriate for her 24,000,000 acres of forested land? Just $15,150 annually.

The following summary shows what each State has done to conserve her timber resources:

Alabama.

In 1907, a State Commission of Forestry was created, consisting of the Governor; a member of the State Tax Commission; the State Game and Fish Commissioner; the Commissioner of Agriculture and Industries; one practical lumberman engaged in the manufacture of lumber in the State, who is appointed by the Governor to serve for a term of five years; a member of the United States Forest Service, recommended by the Forester of the said Forest Service; and the Professor of Forestry in the Alabama Polytechnic Institute.

The members of this commission receive no compensation. Five hundred dollars ($500.00) is appropriated annually for the purpose of carrying out the provisions of the forestry acts and for the payment of the incidental expenses of the Commission of Forestry. All sheriffs, deputy sheriffs, constables, marshals, justices of the peace and other peace officers of the State are declared ex officio deputy forest wardens and are required to enforce all forest laws of the State. Deputy forest wardens who serve without compensation are also appointed by the Governor, on the recommendation of the Commissioner of Forestry.

California.

The California State Board of Forestry is composed of the Governor, Secretary of State, Attorney General and the State Forester. The State Forester is appointed by the Governor. His term of office is during the pleasure of the Governor. The Deputy State Forester and the Assistant State Forester are appointed by the State Forester and hold office during his pleasure. The biennial appropriation for forestry is $30,300. This is divided as follows: Salaries, $12,800; support, $15,000; and printing, $2,500. The salaries of the State Forester, his deputy and assistant are paid from the salary fund and are fixed by statute as follows:

State Forester, $3,000 a year; Deputy State Forester, $1,800 a year; and Assistant State Forester, $1,600 a year. The firewardens are voluntary and are appointed by the State Forester.

Connecticut.

Appropriations in this State are made for biennial periods by the general Assembly, which convenes in odd years. The forestry work centers in the Agricultural Experiment Station. The forester of the station is, by law, State Forester and ex officio State Forest Firewarden. His salary and that of the Assistant State Forester is paid by the Agricultural Experiment Station, and both of these officials are appointed by the Board of Control of the Experimental Station. The salary of the State Forester is $2,500 a year, and of the Assistant State Forester $1,500. Town and district firewardens receive 35 cents per hour, and assistants or laborers at forest fires receive 20 cents per hour. Pay of patrolmen cannot exceed $2.50 per day. The biennial appropriation for maintenance and general expenses is $3,000; for the purchase of state forests, $5,000; and for the forest firewarden $3,000. This latter appropriation covers the traveling and other expenses of the State Forester in connection with firewarden duties and one quarter of the expenses of the towns in extinguishing fires. Besides this, the office is provided annually with a budget of approximately $7,000 by the experimental station. From this budget, the salaries of the State Forester and Assistant State Forester as well as the expenses of the experimental station work in forestry are paid. This work has chiefly been connected with the nursery and planting experiments and educational work.

Hawaii.

The Division of Forestry is a branch of the Territorial Board of Agriculture and Forestry. The members of the Board of Commissioners of Agriculture and Forestry are unpaid, but provision is made for the payment of their traveling expenses. The Superintendent of Forestry, who is also ex officio Chief Firewarden, has a statutory salary of $3,000 per annum. His assistant, who holds the title "Forest Nurseryman," receives $1,800 per annum. Since 1909, all the expenses of the board of Agriculture and Forestry have come from the conservation fund, raised by special immigration conservation income tax. This has been turned over in a lump sum at the rate of about $3,500 a month. Of this sum, the total allotment to the Division of Forestry has been about $14,000 per year.

Indiana.

The Indiana State Board of Forestry consists of a secretary and four other members. The salaries are fixed by statute as follows: Secretary of board, $1,800; stenographer to secretary, $600; four board members, $400; mileage of four board members, $58.28; general office expense and mileage, $1,000, making a total of $3,858.28. Besides this an appropriation of $3,000 a year is made for the Forest Reservation and Experimental Station. The legislature convenes biennially but this appropriation is annual.

Kentucky.

The State Board of Forestry in Kentucky consists of six members; namely, the Governor, the Director of the Experimental Station, the Commissioner of Agriculture, who are ex officio members, and three others, who are appointed by the Governor. The members of the board receive no compensation, except actual expenses incurred in the performance of their duties. The State Forester is appointed by the board for a term of four years. His salary is fixed by the State Board of Forestry at a sum not to exceed $2,500 per annum, and his traveling and field expenses. An annual appropriation of $15,000 is made to cover all forestry expenses, including salaries. The forest wardens are paid a sum not exceeding $2.00 per day for each day of services. They are commissioned by the Governor on the application of the State Board of Forestry, and are paid out of the general appropriation.

Louisiana.

The registrar of the land office is ex officio forester. He receives a salary of $500 and has an expense fund of $300 per annum. The deputy forester is appointed by the Governor, on recommendation of the Conservation Commission, for a period of one year at a time. He receives a salary of $1,800 per annum and has an allowance of $600 per year for office and traveling expenses, which is paid out of the conservation fund. This fund is derived from an annual license tax upon all persons, business firms and corporations pursuing the business of severing timber and minerals from the soil. This fund amounts to from $50,000 to $75,000 per annum, and the greater portion is expended for care and protection of the forests.

Maine.

In this State the land agent is also forest commissioner and the chief clerk to the land agent is deputy forest commissioner. The salary of the land agent and forest commissioner combined is $2,500 annually and the salary of the chief clerk and deputy forest commissioner is $1,500 annually. The appropriation in 1912 for forest fire protection was $67,922.47. This sum was arrived at by a tax of a mill and one-half basis upon the valuation of the wild lands for taxation purposes. There is also an appropriation of $2,500 for public instruction in forestry, which is used to maintain a chair of forestry at the University of Maine. The Maine legislature meets biennially on the odd years, but separate appropriations are made to cover the two years. The chief forest firewardens and the deputy forest firewardens are appointed in the various forestry districts by the Forest Commissioner. The chief forest firewardens receive as compensation $3.00 for each day of actual service, with an allowance for expenses of travel and subsistance not to exceed $2.00 daily for such period. The deputy forest firewardens receive $2.00 and subsistence for each day of actual service.

Maryland.

The Maryland State board of Forestry is composed of seven men, of whom the Governor is president. The State Forester is the only statutory appointee of the board, at a salary of $2,000 per annum. All expenses of the board and the salaries of clerks and field assistants come out of the general appropriation. The legislature convenes biennially on the even years, but the appropriation is annual. The last legislature made an annual appropriation of $10,000 for the support of the work of the board, and $6,000 for publishing county maps, and also an appropriation of $50,000 for the purchase of forest reserve lands. The forest wardens are commissioned by the Governor and are not authorized to incur any expense until after a fire has been reported to them.

Massachusetts.

The State Forester is appointed by the Governor and council, and he, in turn, appoints his assistants. The legislature meets annually and the appropriations are made annually. The salaries are not designated by law. The Governor and council establish the State Forester's salary, which is $5,000. The salaries of the other officials are regulated by the State Forester subject to the approval of the Governor and council. The appropriations are as follows: $20,000 for general forestry; $10,000 for forest fire work; $10,000 for reforestation; $5,000 for reimbursement to towns for forest fire equipment. Besides this, there is an appropriation of $250,000 for the gypsy and brown-tail moth work, which is in charge of the State Forester. The firewardens are paid out of the appropriation for forest fire work.

Michigan.

The legislature convenes biennially, but the appropriation is annual. The salary of the State Forester is $1,600 per year. The appropriation is apportioned by the Public Domain Commission, to cover salaries and expenses of officials, expenses of members of the Commission and expenditures incurred in the management of the State Forests. The secretary of the Public Domain Commission, who is also Commissioner of Immigration, receives a salary of $2,500 per year. The other members of the Commission are reimbursed for expenses only.

Minnesota.

The State Forester is selected by the State Forestry Board, which, in turn, is selected by various boards, such as the State Forestry Association; the Agricultural Society; the Regents of the University, etc. The members of the board serve without pay. The only statutory position is that of the secretary of the State Forestry Board, at $1,800 a year. The salary of the State Forester is fixed by the board at a sum not to exceed $4,000 a year. The State Forester selects all the other officers of the service, including his assistant, who receives $2,000 a year. The rangers receive from $1,080 to $1,260 a year and their expenses; the patrolmen, $70 a month and pay their own expenses. The legislature convenes in the odd years and appropriations are made biennially, which amount to $100,000. Seventy-five thousand dollars ($75,000) of this fund is for the regular work of the service; $6,000 for the support of the State reserves, and $20,000 for the encouragement of tree planting on the prairie portions of the State.

Montana.

The Montana Board of Forestry is composed of the Registrar of State Lands, the State Land Agent, and the State Forester. No appropriations are made for forestry purposes, and the expenditures are made through the State Board of Land Commissioners. The State Forester is appointed by the Governor for a term of four years at a salary of $2,500 per annum and expenses when engaged in outside work. The Assistant State Forester is appointed by the State Board of Land Commissioners for such time as is necessary. He draws pay only when actually engaged in the performance of such work and his pay cannot exceed $150 per month. The firewardens are voluntary.

New York.

The Conservation Commission is divided into three offices: Water Supply, Fish and Game, and Lands and Forests. It is composed of three commissioners at $10,000 a year, and three deputy commissioners at $3,500. The division of lands and Forests has at its head a Superintendent of State Forests at $3,200; an assistant at $2,000; a chief surveyor at $2,500; five foresters at from $1,000 to $1,800; four locomotive inspectors at $1,200; a pathologist at $1,500, and over a hundred fire patrolmen at from $60 to $75 per month, about 30 of whom are employed the year around, and the rest about six months. There is also an auditor of fire accounts at $1,800; a special agent at $1,800 and five superintendents of fire at $1,200 per annum.

The appropriations are made annually as follows: $75,000 reappropriated and $25,000 newly appropriated for the acquirement of land in the State reserves; $25,000 for the enforcement of the conservation laws; $5,000 for the protection of the State's title to lands, by surveys, etc.; $50,000 for fire protection; $25,000 for general expenses of the Lands and Forest Department. Aside from the above, the salary list of those below State Foresters (patrolmen, stenographers, etc.) amounts to $27,000. All the offices of the Lands and Forest Department, except those of patrolmen and superintendent of fires, are under civil service. All the offices of the general commission, except those of stenographers are appointee.

North Carolina.

The forestry work is considered as a part of the work of the North Carolina Geological and Economic Survey. The total annual appropriation for this department is $15,000 and of this amount, about $3,000 is devoted to forestry work. The salary of the State Forester is $1,800 per annum. This is determined by the State Geological Board, which is appointed by the Governor.

Ohio.

The department of forestry in Ohio is at the State Agricultural Experiment Station and is under the supervision and management of the Board of Control, which is virtually a Forestry Commission. The members of the board receive no compensation. The appropriations, which are biennial, amounted to $19,500 in 1911. The organization of the department consists of the chief, paying $2,000; that of first assistant, paying $1,200. These offices are appointed by the Board of Control of the station. The expenses of the Board of Control are provided for out of the general fund of the station.

Oregon.

The State Board of Forestry consists of the Governor, the acting head of the Forest School of the Oregon Agricultural College, and five electors of the State appointed by the Governor upon the recommendation of five associations in the State. The members of the board receive no compensation for their services, but are entitled to actual expenses incurred in attending board meetings. The legislature meets in the odd years and an appropriation of $60,000 is made for the biennial period. The State Forester is appointed by the State Board, to hold office during the pleasure of the State Board, which also fixes his salary at $3.000 per year. He is authorized to appoint a deputy, whose salary is fixed by the board at $1,800 per year. These salaries are the maximum under the law. In 1911, 23 supervising firewardens were employed from June 1st to October 1st, at a salary of $100 per month and expenses. Voluntary firewardens are also appointed throughout the State by the State Forester.

Pennsylvania.

The legislature convenes in the odd numbered years and the appropriations are biennial. The statutory appointments are as follows:

Commissioner of Forestry	$3,000 00
Deputy Commissioner	2,500 00
Two Clerks, each	1,500 00

The appropriations made in 1911 for use for two years were:

Foresters	$110,000 00
Rangers	125,000 00
Labor	100,000 00
Surveys	10,000 00
Draughtsmen and Supplies	12,000 00
Examination of Titles	5,000 00
Expenses members of commission	3,500 00
Incidentals	55,000 00
Contingent	6,000 00
Academy	20,000 00
Purchase of lands	50.000 00
Forest fires	50,000 00
Tax on lands of schools and roads	80,000 00
Total	$546,500 00

This appropriation for foresters is to pay the salaries and expenses of the foresters who are in the employ of the State and in charge of the Forest Reserves and other forestry work. Their salaries range from $60 to $150 per month.

The appropriation for rangers covers the salaries of those men who are entirely on the forest reserves, with salaries ranging from $25 to $60 per month. The foresters and rangers are appointed by the reservation and forty-one of the foresters are graduates from their Forest Academy.

The labor appropriation is to cover expenses of all kinds for labor connected with the reserves by individuals other than foresters and rangers.

Surveys, draughtsmen and supplies covers the expenses for surveying the exterior borders of the State forestry land, making the necessary maps, etc.

The incidental appropriation covers any work of the department not otherwise provided for in the specific appropriations, such as dissemination of information to the public, pamphlets, bulletins, etc.

Contingent expenses cover the expenses of the office. The forest fire appropriation is for the extinguishing of forest fires anywhere in the State.

The taxation on lands covers the payment by the department of two cents per acre for roads and two cents per acre for schools, on each acre owned by the State in the various townships.

In addition to the Commissioner of Forestry, there are four members of the State Forestry Reservation Commisison who are appointed by the Governor. These individuals receive no salary, simply being paid their expenses in connection with the work of the Commission. There is also a chief surveyor at a salary of $1.800 per year, and a forest inspector at a salary of $2,100. There is also one stenographer in the department receiving $720; one bookkeeper at $900 and one at $1.200. These are all appointed by the department, and not by legislative enactment.

Rhode Island.

The Legislature convenes annually and the appropriations are annual. There is a Commissioner of Forestry at a salary of $1,000 per annum. Five hundred dollars per annum is appropriated for the expenses of the office and $1,500 per annum is appropriated for fighting forest fires.

Vermont.

The appropriation for forestry purposes is part of a blanket appropriation for agriculture and forestry, $20,000 a year being apportioned for the two lines of work. This money is divided by the State Board of Agriculture and Forestry between the two departments according to their needs; this year forestry received $11,000 of this amount. The expenditure in connection with the prevention of fires does not come out of this appropriation. Those expenses are paid by the towns and the towns are reimbursed by the State for any sums paid out over 5 per cent of their grand list. This reimbursement comes out of the general treasury of the State.

The legislature convenes in the even years. The only statutory appointment is that of State Forester, whose salary is fixed by statute at not to exceed $2,500. The exact amount is decided by the State Board of Agriculture and Forestry.

Washington.

The State Board of Forest Commissioners consists of the State Land Commissioner and four electors of the State, appointed by the Governor. They receive no compensation for their service, but are allowed necessary expenses incurred in the performance of their duties. The legislature convenes on odd years and the appropriations are biennial. The appropriations for the years 1911-12 were as follows:

State Forester and firewarden	$ 4,000.00
State firewarden and forest fire service	71,000.00
Firewarden—printing fund	1,000.00
Total	$76,000.00

The State Forester is appointed by the Board of Commissioners. He is also state firewarden. The assitsant state firewarden receives a salary of $1,200 a year. A forest fire service is maintained during four months of the year—June, July, August and September—in twenty-three of the timbered counties of the State. At the beginning of the fire season, a firewarden is appointed in each county and later in the season, when conditions demand greater supervision, others are appointed. The appropriation under state firewarden and forest fire service covers clerk hire, office and miscellaneous expenses. The largest part of this is expended in paying and rimbursing firewardens and men employed in fighting forest fires.

Each warden receives compensation not to exceed $4.00 per day, and also necessary and proper expenses for the time actually employed. The salaries and necessary expenses of all wardens, together with all expenses incurred in forest fire protection, are borne in the proportion of two thirds by the State and one third by the county in which the service was given and the expense incurred for forest fire protection.

West Virginia.

There is no direct appropriation for forestry in this State. The work is included under the department of forest, game and fish, and the forest, game and fish warden has charge of the work. The only effort being made is in the control of forest fires. All deputy wardens are also ex officio fire wardens and receive two dollars a day for all time actually employed in putting out fires. All expenses incurred in extinguishing fires are required to be paid by the county in which the fire is located. The forest, game and fish warden receives a salary of $1,800 per annum. He has two chief deputies who each receive a salary of $900 per annum and their traveling expenses.

Wisconsin.

The members of the State Board of Forestry receive no compensation. They are allowed their expenses incurred in the performance of their duties. The legislature convenes biennially on the odd years, but most of the appropriations are annual. The appropriations are as follows: Administrative, $35,000 a year; for purchase of forest reserve lands, $10,000 a year; for purchase of forest reserve lands, $50,000 for five years; forest reserve fund, about $75,000 a year.

This forest reserve fund consists of the proceeds of all sales of scattering and agricultural lands, timber, etc. This fund varies, but the income has been averaging about $75,000 per anum.

Three salaries are fixed by statute provision, namely: State Forester, $3,600 per annum; assistant state forester, $2,000 per annum; chief clerk, $1,500 per annum. All other salaries of cruisers, rangers, forest assistants, etc., are paid out of the general fund, the salaries being fixed either by the State Board of Forestry or the State Forester.

The following comparative table gives a summary of the appropriations of the various states in which forestry work is being conducted. Special attention is called to the acreage of timbered land and their corresponding appropriations:

COMPARATIVE TABLE OF APPROPRIATIONS FOR FORESTRY WORK.

State.	ANNUAL FOREST APPROPRIATION.					Total area, acres.*	FOREST AREA.	
	Salary.	Maintenance and general.	Protection.	Purchase of State forests.	Total.		Acres.	Per cent of land area.
Alabama		$500			$500	32,818,560	20,000,000	61
California	$6,400	8,750			15,150	99,898,880	24,000,000	24
Connecticut		8,500	$1,500	$2,500	12,500	3,084,800	1,600,000	52
Hawaii		14,000			14,000			
Indiana	2,800	4,058			6,858	22,966,400	4,000,000	17
Kentucky		15,000			15,000	27,715,840	10,000,000	39
Louisiana	2,300	900	62,500		65,700	29,061,760	16,500,000	57
Maine	4,000	2,500	67,922		74,422	19,132,800	14,900,000	78
Maryland	2,000	16,000		50,000	68,000	6,362,240	2,200,000	35
Massachusetts		280,000	15,000		295,000	5,144,960	2,000,000	39
Michigan		15,000			15,000	36,787,200	15,500,000	42
Minnesota	1,800	50,500			52,300	51,749,120	15,500,000	30
Montana	2,500				2,500	93,293,640	18,000,000	19
New York	61,800	55,000	50,000	100,000	266,800	30,498,560	12,000,000	39
North Carolina		3,000			3,000	31,193,600	19,600,000	63
Ohio		9,750			9,750	26,073,600	4,800,000	18
Oregon		30,000			30,000	61,188,480	27,000,000	44
Pennsylvania	7,000	223,250	25,000	25,000	280,250	28,692,480	9,200,000	32
Rhode Island	1,000	500	1,500		3,000	682,880	250,000	37
Vermont	2,500	11,000			13,500	5,839,360	2,500,000	43
Washington	2,000	500	35,500		38,000	42,775,040	25,000,000	58
Wisconsin	7,100	110,000		20,000	137,100	35,363,840	16,000,000	45

*Area, and Forest Area: "Report of the National Conservation Commission," Vol. 2, page 346.

State Forest Reserves.

It is probable that much of the logged-off land will not be reforested unless the work is undertaken by the State. Some States have already adopted the policy of acquiring such land for State forest reserves. In some instances large appropriations have been made for this purpose. In our own State a start could be made, without cost, by retaining delinquent tax land at the expiration of the redemption period. Such areas, which are proved upon examination to be of value for forest purposes, should be permanently withdrawn from sale, and the remainder released. This question has not yet been given much attention. It deserves consideration, however.

The following table shows the progress made by other States in establishing State forest reserves:

State.	Area in acres.
Indiana	2,000
New York	1,641,523
Pennsylvania	920,763
Michigan	231,349.58
Massachusetts	2,000
Connecticut	1,509
Maryland	1,960
New Jersey	13,720
Wisconsin	385,000
Vermont	1,760
Minnesota	51,000
Kansas	600
Total	3,253,184.58

CHAPTER VI.

FORESTRY.

MANAGEMENT, PROTECTION AND WOOD PRESERVATION.

Because of numerous inquiries received and the popular interest displayed of late by teachers and others desiring a brief and concise discussion of forestry, this chapter is written. Forest literature is most incomplete: is scattered in various Government and State publications, and is often not available. The following topics are chosen because they are the ones in which there seems to be the most interest.

Definition of Forestry.

By forestry is meant the management and culture of a forest in such a way as to yield repeated or future crops of timber. Lumbering operations have been paying little or no attention to a future crop and have devastated the forests to such an extent that natural reproduction is not always possible. When a forest is cut, the forester aims to replace it by a new growth, protect the seedlings and young trees, which by the old lumbering methods were oftentimes destroyed, and so obtain from the forest, the highest possible yield, profitably as well as conservatively.

A forester, then, must have a thorough knowledge of the life and characteristics of trees, must know the art of forest reproduction and be familiar with and experienced in modern logging, to carry out forest policies in a practical manner.

The Importance of Forests.

The importance of forests lies chiefly in the numerous uses to which they are put. As a whole, they are of importance in providing shelter and food for certain of our domestic animals, protecting agricultural land in their vicinity, harboring game, preventing erosion in one locality and fixing drifting sand in another, in beautifying the landscape in general, and furnishing healthy employment to many.

Influence of the Forest on Climate and Soil.

The beneficial effects of forests on the land in their vicinity was formerly, and to some extent still is, somewhat exaggerated, or at least sought for in the wrong direction. To the forest was attributed the capability of altering the temperature, regulating precipitation, and controlling the humidity of the atmosphere. In fact, the impression conveyed by these statements was, that whatever imperfection the climate of the district possessed might be remedied by the establishment of forests. However, the forest is not without its favorable effects by any means. Apart from the fact that they add organic matter to the soil, forests have a beneficial action in

(1) Preventing direct sunlight from reaching the soil,
(2) Breaking the force of the wind,
(3) Reducing the force of heavy rains, and
(4) Binding soils apt to be carried away by flooding and drifting.

In hilly country the prevention of erosion is, without doubt, of great importance. The water from heavy rains, checked in its descent by meeting first with the foliage of the trees, is better retained in forest soil than on bare land. Under a close cover of trees there collects a humus soil formed from the decay of fallen leaves. Through this soil-covering the rain slowly filters, and its passage is further retarded by the stems and roots of the trees. In this way the erosive effects of heavy rains on bare hillsides are interrupted.

In the case of shifting sands, the roots of trees, shrubs, and wild plants, and the covering of humus formed from dead leaves, serve to bind the soil. Forest growth is essential in such cases, for, when level tracts of loose soil, without forest or other cover, are exposed to the wind, sand dunes are apt to be formed. These advance in the direction of the prevailing wind, oftentimes destroying valuable agricultural lands.

Sylviculture.

The reproducing of the forest, known technically as sylviculture, is next of importance in our discussion.

The aim in establishing a forest, is to constantly produce under given conditions, the most valuable timber crop with the least expenditure of time and money consistent with good results. In other words, sylviculture involves the art of establishing, developing and maintaining a forest.

1. *Establishing forests*—The seed stage of plant or tree life. This may be carried on by

a. Natural reproduction; or

b. Artificial reproduction which denotes seeding or planting.

2. *Developing forests*—Involves the care, culture and protection of these seed or plant areas in such a manner as to secure a good crop with the largest possible returns in the shortest period of time. The objects, therefore, of sylviculture may be

(1) To secure quick reproduction after the timber has been removed.

(2) To produce species which will give best returns. That is, produce valuable marketable species.

(3) To manage the area so as to produce a full crop of good quality and form.

(4) To obtain an annual yield and to accomplish all this on a practical rather than a theoretical basis.

(1) *Quick Reproduction*. This, in many cases, is hard to obtain because of the abuse to which forests have been subjected. Especially is this true where clear cuttings have been made, thus making the area easily susceptible to fire and entirely killing whatever natural reproduction may be present. Take, for example, the formerly timbered areas of Michigan and Pennsylvania. Their forests were cleared by lumbering and fires. This, in many cases, is true even in California and in many cases these cleared tracts are covered entirely with chaparral and worthless brush. The areas are as capable as formerly to produce good timber, but the seed trees necessary for reproduction have been destroyed, and consequently many years will be required for natural reproduction to take place. Even where fire has not played so important a part, but where the usual lumbering methods have been carried on, reproduction is none too fast. Loss of growth is the result, the soil lies idle and the time existing between cutting the timber to the maturity of a new crop is much longer than necessary.

(2) *Species*. A term much used in technical forestry is "locality." It comprehends both soil and climate—the latter being influenced by situation, as they effect tree growth. The locality largely determines the species to grow and the sylvicultural treatment to adopt for a given area.

Here is where the managerial ability of the forester comes in. Apart from the general management of the forest, the prosperity of the trees depends upon the physical and chemical composition of the soil, the geographical position, the altitude, slope and aspect of the ground. In selecting trees or determining a species to be grown, general conditions that are found to prevail must be considered.

Market, undoubtedly, in many cases determines the species to be grown, providing of course that the soil is capable of producing market-demanding species.

The quantity of moisture in the soil has a very great influence in determining the species which will grow, for on dry soils occurs one type of tree, and on wet soils, another.

The purpose of sylviculture is to improve the composition of the forest, so that a given area will be occupied by the species best adapted to the existing conditions.

(3) *Full crop of good quality and form*. Sylviculture not only aims to reproduce forests but to produce as many trees and of as good quality per acre as is possible. Under good methods of forestry our American forests should produce more timber. At present they are not doing this, the reason being that the stands are very irregular. Many trees are crowded, or growing in the open, the latter with their wide-spreading branches occupying a great deal of space to the exclusion of other trees. Then again, there are many open spaces occupied by brush, shrubs, or are entirely bare, that might be growing trees.

Forests usually contain large numbers of trees that are crooked or forked, or have low branches which hinder their otherwise high commercial value. Usually, such trees are good only for firewood though they are large enough and of the right species to furnish good timber. Thus, frequently, one sees a stand, one hundred years old, with trees of such poor form that the timber is worth only a small percentage of what it would have been had it been managed properly.

(4) *Annual Yield*. In the establishment of forests the aim must always be to constantly produce for the given conditions, the most valuable timber crop with the least expenditure of time and money consistent with good results.

To perpetuate such an aim, a forest must yield annually, or over some other convenient period, certain amounts of timber. Thus defined, the sustained or annual yield of the forest is that number of cubic feet which a forest produces annually; the annual removal of this amount of timber then, will not decrease the original amount of stumpage.

An annual yield offers to the lumberjack steady employment in one and the same forest or sawmill, while to the owner, an annual yield offers approximately equal annual dividends.

Where no yield is possible for a series of years, the outlay of taxes, protection and administration usually prohibits the owner from attempting conservation.

The Tending of Woods.

In the management of growing woods, attention must be given, not only to the immediate wants of a crop, but also to the preservation of the fertility of the soil.

An intimate relationship exists between the forest and the forest soil. Leaves, needles and dead twigs, cast down by the trees, form a mulch of decomposed and decomposing organic matter. This mulch or humus is very valuable to the forester as it supplies plant food to the tree; it retains moisture in the soil and absorbs it from a damp atmosphere; it lessens or breaks up a stiff soil and makes an overloose soil compact. The preservation of this valuable product ought to be the constant care of the forester. Its presence, as mentioned above, makes a poor soil rich; without it, even the good soil deteriorates.

Weeding or Preliminary Thinning.

This operation takes place after a young crop has been commenced, from seeding or planting. In other words, the term "weeding" implies the act of removing early material not intended to take part in the development of the wood. This condition is usually brought about by keeping the young plants close together and limiting the light to the upper portion of the crowns. In places where the young trees are apt to suffer badly from bending or crushing by snow, it has been found best to merely take the tops from undesirable members rather than to at once cut them away entirely.

"Weedings" should be begun early, be carefully carried out, and confined to the clearing away of individuals that threaten to injure the welfare of the young wood.

Thinnings.

Late "weeding" and early "thinning" are similar in that they consist in the removal of wide-spreading, misshapen, and other objectionable trees. As crowding begins to have its effect, the dead and dying trees increase in number, and the young wood should be relieved of these. The first thinning usually takes place from the fifteenth to thirtieth years. Nothing but the cost of operation need deter the forester from making a thinning at any time. no matter how early.

The object of thinning from a sylvicultural standpoint, may be defined as the production of straight healthy stems of proportionate diameters but free from side branches. Through the maintenance of a very close crop in the early periods of growth, the later thinnings may be devoted more and more to the development of the better trees. This consists in the removal of trees that have recently passed into a sickly, dying and dead condition.

There is a struggle for existence in woods of proper density which continues through the life of the wood. This struggle is chiefly among the crowns, which compete with each other for space and light. This competition is due to there being more trees upon the area than can possibly grow and live. As the light is to be had from above only, all the trees press upward in long, straight growths. The shade of the crowns has, further, the effect of making clean stems by ridding the trees of their side branches.

Because of these influences imposed by density, certain cuttings and thinnings become essential; the frequency of thinnings is determined by the energy of growth in the woods' development. In young woods the interval is generally about five or six years, and in older woods, ten to fifteen years.

Crown development, therefore, is the guide for carrying out thinnings. Three general sections may be considered, the Dominant, Co-dominant or secondary, and dead trees.

1. Dominant trees are those which possess well-formed crowns and occupying the upper position in the crop.
2. Co-dominant trees comprise the lagging, overtopped, and dying stems.

Trees are constantly being crowded out of the principal into the inferior classes. Occasionally, however, a portion of the crop raises itself from the latter to the former class.

Attention to soil and wood crop and the increase of the total production of good and useful timber are the objects aimed at in the modern system of thinning. The yield which the cuttings give is of minor importance.

Uses of Thinnings.

The practical results derived from thinnings are as follows:

1. Improved quality of product. The forester can develop timber of high quality, produce good merchantable lengths and obtain even the straight-grained lumber. He also reduces the percentage of crooked and forked trees.
2. Rapid growth of trees. A crop can be in a mature state several years earlier than without thinning.
3. Total yield is increased.
4. Better and more cordwood.
5. Less danger from fire, as the débris, slash, etc., is removed.

Sylviculture covers a large field and involves several other subjects not mentioned in this discussion. The formation of woods by seeding and planting could be handled more in detail, as well as describing nurseries, testing seeds, collecting and storing seeds, methods of sowing, soil cultivation, planting, transplanting, etc., but that would be going into a detailed discussion and this chapter was intended merely as a general one.

Pruning.

Natural pruning is the rule in sylviculture. The crowns in a close wood monopolize the light and compel the lower branches to die through overshading. But, there are cases when artificial pruning is required, to prevent young plants being harmed by the branches of larger trees suppressing them. Pruning carried out to increase the commercial value of the timber should be restricted to the removal of dead and the lower of the weak green branches. Trees with strong lower branches left as shelter or for seed when regenerating forest ground, are often pruned to relieve the young crop at a time when their complete removal would be dangerous.

The season for pruning is usually from October to February or the early part of the winter.

Forest Protection.

By forest protection is meant the preservation of forests against damage by man and that brought about by natural influences, such as animals, noxious plants and atmospheric influences.

1. Forest protection against damage caused by man. In safeguarding the forest against the advances and trespass of man, it is of vital importance that all boundaries of the forest be defined by means of landmarks. Artificial landmarks, such as fences, ditches, stones and stakes, are the usual form used in marking boundaries.

2. Protection against fire. In virgin forests, fires originate in clearing land for farming, lumbering, in extending pasturage, in failing to extinguish camp fires, etc. They are generally the result of carelessness or recklessness, the throwing away of lighted matches, cigar and cigarette butts, lack of proper attention to fires lighted for the disposal of slash, lightning, and various other causes. Occasionally, they can be traced to incendiarism, and sparks from railway engines are also very dangerous. For these reasons, the United States seems to be subject to large forest fires annually.

Forest fires are most common during the summer months, especially after a long period of drought. Young coniferous woods are those most liable to fire because the soil covering of needles and twigs is very inflammable, and, when lighted leads not only to its own destruction, but generally to that of the trees as well.

Forest fires may be divided into the following three classes:

1. Surface fires: The commonest form, a burning of the litter or soil covering of leaves, twigs, grass, etc.
2. Crown fires so frequent and disastrous in the United States. These burn the crowns (foliage and branches), and usually originate from surface fires.
3. Ground or deep soil fires which on account of the peaty nature of the soil burn slowly but persistently. Practically the only way to extinguish a fire of this nature is to cut trenches down to the mineral soil, when the peat is not too deep, and run water along the trenches or flood the area.

The character of a fire is greatly influenced by the condition of the atmosphere. The greater the velocity of the wind the more rapid the progress of the fire. A fire burns more severely when the wind is constant than when it is gusty, and burns more fiercely when the atmosphere is dry. Fires therefore, are more severe during the hot part of the day and are retarded at night when the atmosphere is moist. The assertion often made that night is the best time to fight fire is thus explained. At night the air is usually damp and heavy, accompanied by little or no wind.

Preventing Fires.

Preventive measures should aim at lessening the risk and limiting the extent of forest fires as much as possible.

A system of fire lines, that is, intersecting or joining trails should be arranged through the forest, a patrol system, telephone system, and lookout stations manned by responsible men should also be installed. Above all, have an efficient fire-preventing and fire-fighting organization. The fire lines would prove valuable, both as a means of transportation, as well as a means to back fire from, and the other systems, mentioned above, would afford a means of quickly detecting and locating fires, as well as notifying the proper authorities when in need of assistance.

Restrictions as to lighting fires within the forest and the smoking of tobacco should be made, coming into effect during the dangerous season of the year at least. Locomotives passing through forest areas should be equipped with spark arresters to prevent the throwing of live cinders and sparks.

Nearly all forest fires start as surface fires, but once under way, can easily enough develop into crown fires. At first the front of a surface fire is narrow, but gradually, with its increase in velocity, due to the draught, widens and takes the form of a broad irregular line. This front may develop in proportions from a few feet to a number of miles in width. Of course, the intensity of a surface fire will depend greatly upon the inflammable material, topography, character of soil and the atmospheric condition. Forest fires are usually fought by means of trails, constructed around a fire. These trails are patroled until the fire is out to prevent its crossing and spreading. Since fire runs up hill with a greater rapidity than down, trails should be constructed along the tops and bottoms of ridges, so far as conditions will permit. Such fires do less damage, they burning with greater velocity than those located on level ground where fires burn steadily, gathering greater volume and extending over vast areas.

In fighting fires in California, it is usually necessary to back fire. Back firing consists in burning along the fire lines toward the burning area. It proceeds slowly against the wind and prevents the main fire from "jumping" the "line." In this way the force of the fire is broken. A careful watch must be kept until the danger of a new outbreak has passed. Any practical plan of fire protection must be reinforced by State fire laws, and a competent organization to enforce them.

Damage by Fire.

The more important damages caused by fire are:

1. Injury to the soil and ground cover.
2. Injury or death to standing timber.
3. Killing reproduction.
4. Destruction of game and its food supply.
5. Financial loss.

1. Injury to the soil and ground cover. In every forest a certain amount of humus is mixed with the mineral soil and is very essential to good ground cover. If a forest is burned, the humus in mixture with the mineral soil, gradually disappears, and since the leaves which fall are destroyed and no new humus is formed, the soil is injured. Fires, by destroying the humus, make the soil susceptible to erosion, thus taking away the moisture-holding ability of the ground cover.

2. Injury or death to standing timber. Many trees, and especially young trees, are entirely consumed by fire. If they are not burned outright, they usually are so badly scorched that the buds, foliage and living tissues are killed. Surface and ground fires both are very dangerous in this respect, the latter burning slower but nevertheless generating enough heat to kill the living tissues of the roots. Many fires do not kill a tree outright, but merely kill a portion of the roots or trunks. A tree being burned on one side, which is usually the case, may live for a long period and if the wound is not large it may heal. Commonly, when one side of a tree is killed, fungus diseases attack it, and trees partially injured and weakened by fire are subject to the attack of insects.

3. Killing reproduction. The greatest damage done by fire is that of destroying the young growth. They burn easily, especially the conifers which usually are totally destroyed. Light fires which often run over the ground and which are often thought of no consequence, destroy the seeds in the surface soil and the young tree seedlings, besides injuring the forest floor. This state of affairs will not warrant the reproduction of a forest.

4. Destruction of game. When the forest is burned, our valuable game goes to other regions. They are either killed outright or must seek shelter and feeding grounds elsewhere. This is of vital importance to the sportsman if he will have

game to hunt in the future and he should assist in every manner possible to protect our forests against fire. Game must have feeding grounds and forest fires make this impossible.

5. Financial loss. Valuable timber holdings and oftentimes homes, are totally destroyed by forest fires, thus rendering many penniless and homeless. Again, as in the case of the big fires of 1910 in Idaho and Montana, many lives were lost. Is not fire protection worthy of our attention?

Protection against Mammals and Birds.

The animals, harmful to woods, may be considered in the following order:

1. Domestic grazing animals.
2. Game and rodents.

1. Domestic grazing animals destroy the forest by nibbling buds, shoots, and leaves, trampling upon seedlings and young growth and in various other ways. Goats and sheep are the most harmful, they killing the young growth. Cattle in a forest do not damage trees to a very great extent, preferring grass if it be present; still, both they and horses bite and tear plants, as well as injuring surface roots by treading. These animals therefore should be allowed entrance only when they can do the minimum of damage.

2. Game and rodents. A great number of the woods in the country have been regarded as harbors for game. This is true and game will always, if protected properly, live in the forest; it is their home. Nevertheless, in many cases, game is damaging our forests.

The most harmful of the animals considered as game, is the rabbit. It bites and gnaws the bark of woody plants, and nibbles the young shoots of practically all species of forest trees. Rabbits multiply very rapidly, and, because of their great numbers, do considerable damage. Deer also injure young trees very seriously by browsing on the twigs and by rubbing off the velvet from their horns. In doing the latter, the buck usually selects young and slender trees.

Rodents: Of the small rodents, squirrels and mice inflict the most damage. The squirrel is well known to eat and stow away seeds and to bite off twigs for the sake of the buds on which he feeds. It also has a habit of stripping the bark from young trees.

Mice do serious damage by gnawing the bark of young trees, eating acorns and beech nuts and wasting seed beds in nurseries. The wood or field mouse kills plants by severing the roots just below the surface of the ground and by gnawing the stems. When planting in a nursery therefore the seeds should first be coated with red lead.

Birds are troublesome, chiefly in the forest nursery, where they scratch up the seeds, or first leaves. However, most birds, by destroying insects, are much more useful than injurious.

Protection against Insects.

Now we are all familiar with animals and rodents, but did you ever sit down on an old log and notice the myriads of ants, beetles, butterflies and other members of the insect army? They are numerous to be sure and to every animal, there are many insects in a forest. In this vast army of insects the forest has many enemies, some of which do a great deal of harm. In fact, next to fire the greatest damage to forests is done by insects. Sometimes, because of their great numbers vast areas of forests are attacked and rendered worthless. Their damage is generally most severe after forests have been burned. Perhaps the most extensive damage is that done by bark beetles, which burrow in the inner bark of the trunk and girdle the trees.

Damage due to Natural Influences.

The forest is exposed to many dangers difficult to fight, but it is practically defenseless against such elements as storm, snow, frost and drought. Yet, even in resistance to these, man has devised certain measures, which, while they are not able at all times to prevent damage, can frequently retard to a certain extent.

Storm.

Wind storms may affect quite an area, cutting out strips or belts of trees and leaving the rest of the forest untouched: or they may be more scattered. It is when gales follow immediately upon heavy rains that have saturated the soil with water, that they prove most destructive, for the soft ground is then least able to support the roots. The direct damage caused by wind is that of throwing or uprooting the trees, or of breaking the trunk above the surface of the ground. The latter causes the greatest loss.

Of course there is no way of protecting forests against tornadoes, but for ordinary winds and gales, some steps may be adopted. A forest can be made more wind firm by mixing shallow-rooted with deep-rooted species. Windbreaks may be built along exposed borders of woods and a forest may be thinned from youth onward so that stout, thick branched, storm-resistant trees result.

Snow.

Damp snow falling in large flakes clings to trees, and in case of the pine or spruce it is apt to form a continuous cover upon the crowns of a close forest. This, owing to its great weight, bends and breaks the trees, the danger being increased if frost follows the snowstorm and prolongs the time which the trees must support the burden.

Broad-leaved trees are able to resist damage from snow much more readily than conifers, in that they are without foliage in winter. With them, injury is possible only when snowfall takes place unusually early or late.

Very little can be done in defending woods against snow; but careful planting, together with early and frequent thinning, help materially in saving the trees.

Danger from frost and drought is to be feared chiefly during the plants' early youth. Natural regeneration may here be necessary, as the old growth will protect the young. For work in the forest nursery, artificial shading and covering weak species with branches and leaves should be made.

Injuries which may result from frost and the sun are:

1. Frost cracks.
2. Frost lifting.
3. Bark scorching.

1. Frost cracks are longitudinal fissures in the stem caused by intense cold in winter; starting at the bark, they reach more or less deeply into the wood, and may even penetrate to the center of the trees. In some cases these cracks are healed over, but usually are reopened, making the crack larger each season. Oak and elm are frequently subjected to frost cracks.

2. Frost-lifting affects small plants on loose soil. Owing to the freezing of the water present, the soil is heaved up and seedlings with shallow roots are raised with it; the soil regains its former position when warm weather sets in, but the small plants which have been torn away fall over on the surface of the soil and die.

To prevent frost-lifting, avoid stirring the surface soil of nurseries in late summer or autumn and provide a covering of leaves, needles and moss.

3. Bark-scorching occurs on all smooth bark trees; the bark becomes excessively heated by the sun—usually on the west side of the tree—dies, cracks and falls off. Underneath, the sunburned wood is then apt to be destroyed by rotting. Trees with low branches are seldom harmed.

USES OF FORESTRY.

Besides its value as a protective agent as discussed in "The Importance of Forests," forestry plays an important part in sheltering farm crops and orchards from strong winds and avoiding sand dunes and snowslides when in the form of windbreaks. The Middle States have practiced wind-break culture for several years, but the enthusiasm is dying out, owing to the fact that the young farmers have never experienced the period of strong winds which prevailed in the early days, endangering their stock and making their homes almost uninhabitable. They are unable, therefore, to fully appreciate the importance of the wind-breaks built by their fathers.

Railroads are particularly interested in wind-breaks for snow protection, since even a light snow may cause serious damage to traffic. Consequently, to protect their tracks from snow, railroads have, in mountainous regions, constructed miles of snowsheds at considerable expense, and in open country have placed board fences to act as wind-breaks on the windward side of the track. In time, these will be replaced with forest growth, for undoubtedly railroad companies will save much money by so doing. However, a wider right of way will be necessary, and this seems to be the chief objection.

The value of wind-breaks to farmers and ranchers is well in mind, so we will not discuss it any more.

Another very important asset to the rancher is the farm wood lot. Wood lots, the purpose of which is to furnish a wood supply, when properly managed will not only supply the rancher with fuel, but will also provide a means of carrying on a profitable business.

The sugar bush or maple syrup and maple sugar industry is also a profitable proposition which ranchers can practice, because there is always a demand for sugar and syrup.

The growing of medicinal plants has proven profitable in several localities throughout the United States, and really this item should be considered seriously, for there is a perceptible shortage of wild growing native medicinal plants in this country. For this reason, medicinal plants would always find a ready market. For further reading matter on this subject, write to the State Forester for Bulletin No. 2, entitled "Pharmacal Plants and their Culture."

In addition to the projects already mentioned, the growing of Christmas trees has been very profitable in the Lake States. In one case a farmer made a profit of $2,000 from a ten acre tract of black spruce in the short period of seven years.

Forest nurseries all over the country are finding it profitable to grow young trees for forest planting purposes; one can readily see there the vast field for beneficial and profitable uses of forestry.

Mensuration.

By mensuration is meant the determination of the volumes of a forest crop—for instance, determining the volumes of trees, logs, and tracts of timber. This involves cruising, scaling, taking measurements and the making of yield and growth tables, for determining both present and possible future yields. A thorough knowledge of mensuration is essential to one buying or selling logs, determining the value of forests, and especially is it essential to the lumberman.

The unit of measure used in this country for buying and selling logs or tracts of timber is the board measure or board foot. When a man or company wishes to buy logs the question to be determined usually is, what does the tract run per acre, or how many thousand feet of logs have you got on your decks? A board foot is a board 1 by 12 by 12, that is, a board measuring one inch thick, twelve inches wide and twelve inches long. Hence, all measurements referring to the volumes of logs and timber are in board feet. Therefore, to determine the contents of any piece of lumber, multiply the product of the width and thickness in inches by the length in feet and divide by twelve. Thus:

$$\text{A 3 by 6 board 12 feet long has } \frac{3 \text{ by } 6 \text{ by } 12}{12} = 18 \text{ board feet.}$$

The above formula is applicable to sawn lumber only when you have regular measurements. But, as can readily be seen, the board foot contained in a round log could not be determined in this way. In the United States logs are measured in board feet. For this purpose many different log rules or scales for different specie and locality have been constructed. A log rule or scale is supposed to show the amount of lumber which it is estimated can be sawn from a log of a certain diameter and length.

Several conditions must be considered in constructing log rules and for this reason, and because of variance in opinions concerning these conditions, log rules are very inconsistent.

The factors usually taken in consideration in constructing log rules are:

1. Allowance for slab, which is the first piece sawn from a log before actual lumber is obtained. This of course determines the width of the smallest board which may be used, and much waste can result. As an example, if a board eight inches in width is the narrowest that can be used, there will be considerably more waste in slabbing than if a four inch board could be sawn.

2. Kerf or thickness of the saw is important, in that a thick saw will waste more in sawdust than a thin one. In this respect the modern band saw with its kerf of $\frac{1}{8}$ or 3-16 inch is less wasteful than the old-time circular saw, the latter wasting $\frac{1}{4}$ or 5-16 inches every time it goes through a board.

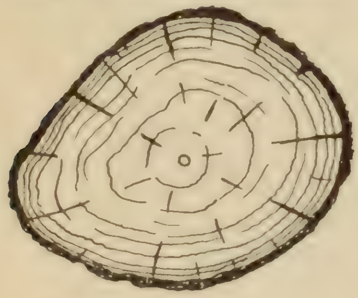
3. Thickness of boards. The fewer the cuts in a log the greater the scale. Thus a log sawed into three or two inch boards will scale more and be less wasteful than one cut into half inch or inch boards.

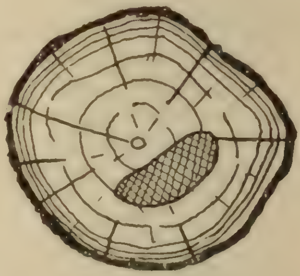
4. The sawyer's judgment is very essential, in that it is his duty and object to get as much lumber with the least waste in slabbing and kerf as possible. Of course he has his stock to fill, but at that he saves all that he can. It means money in the pocket to the millman, and for this reason it behooves him to get the best sawyer available. Other factors which must be considered in constructing log rules are, the defects in itmber, efficiency of mill machinery and the taper of trees.

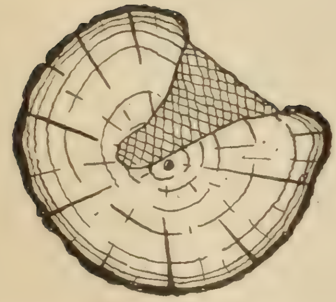
For the above reasons many log rules are in existence and it is hard to say which one is best, a different one being used in nearly every locality. However, the Scribner and Doyle rules are perhaps the best known. The Scribner is the oldest, while the Doyle is used throughout the country, generally speaking. The former is based on computations derived from diagrams drawn to show the number of inch boards that can be sawed from logs of different sizes after allowing for waste, and the Doyle rule is constructed from formula. Following is the formula: Subtract four inches from the diameter of a given log, which is the allowance made for slab; square one fourth of the remainder and multiply by the length of the log.

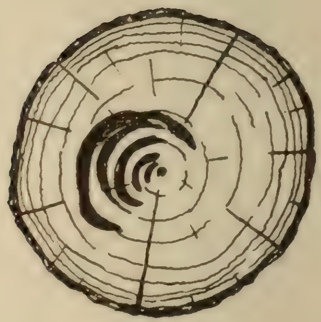
In practice, these figures are placed on a scale or log stick so that on one edge one may find the diameter and directly opposite on its face the contents of the log. Thus, when the "scaler," the title given to the man scaling, wishes to ascertain the contents of a log, the scale is placed on the small end and the diameter inside the bark is noted. The contents may be found directly above on the faced side of the rule. Each line of figures on a scale represents the board feet for one length of log, the length being noted on the left end of the scale. So, when looking for the contents, follow the line of figures representing the length of the log you are scaling. The scaler must be a man of wide experience. It may seem to be an easy operation and one necessitating no skill whatever, to a person unfamiliar with timber; and it would be if all the logs on a skidway were sound and straight. Such is not the case, however, for many logs are cracked, forked, lop-sided and rotten, making deductions necessary when scaling. For these reasons skill is required and oftentimes the scaler must decide whether or not to "cull" certain logs.

The following figures show some of the defects encountered by scalers when determining diameters. (Shaded portions denote defects of rot, wind shake, etc.)









Scaling Logs.

In the New England and Lake States, where logs are cut into short lengths and decked on skidways, a log scaling crew usually consists of two men, one man scaling and stamping while the other tallys or records. However, in many localities only one man is necessary. In measuring the diameters of logs they are rounded to whole inches. Thus, if a log is nearer nine than eight inches in diameter, the log is tallied nine inches. Many careful scalers, however, take the small figure, especially when buying logs for veneering purposes, where the rotary cut must be considered.

When logs are not round, the rule is placed at a point on the log where the diameter is about an average.

The records are commonly made on a blank book or wooden scale paddle in the woods, from which later, in camp, they may be transferred to the regular log tally sheets. In recording measurements the most simple and common way is to tally diameters and lengths, and afterward computing the volume, or, record at the skidway the board contents of each log when scaling.

When a log has been scaled it is usually marked in some way so as not to be scaled a second time. This is usually done with chalk. A log to be culled receives a special mark.

At this time or later the logs are stamped with the marking hammer which bears the proprietor's initial or particular trademark. The principles of scaling are practically the same in any region where short logs are cut. Logs loaded on cars in the woods are usually scaled after loading and on a "drive" logs are scaled before being "spilled" into the river.

Now that the unit of measure, the log rule and its application are in mind, let us turn our attention to the ascertaining of the volume of standing timber properly termed "cruising" or "estimating." Before taking up the various methods of timber cruising volume tables will be discussed. These are used by foresters in surveys.

Volume tables give the average contents of trees of different sizes and may be made for any unit, such as board measure, cubic, cord, etc. And, again, they may be constructed for different localities. The latter is the type used in the United States. They are based on measurements taken in some certain locality and therefore must be made for each new region, say for a township, or any fairly sized area of timber which is to be estimated. Volume tables for trees of different diameters are perhaps the most simple and are in common use in estimating the contents of standing timber. To obtain the total contents of trees of any given diameter, multiply the number of trees by the volume given in the table for that diameter. Thus, if the average volume of a tree 12 inches in diameter is 18 board feet, and you have 200 trees of this diameter, 18 by 200, or 3,600 board feet is the volume. Do this for each diameter to obtain the total volume of the stand.

Method of Constructing Volume Tables.

The tables are based on measurements and computations of large numbers of felled trees and are usually obtained during lumbering operations. A crew of two or three men follow the woodsmen and measure the trees as they are cut.

The measurements necessary in constructing volume tables are:

1. Diameter at breast high (4.5 feet from the ground).
2. Diameter at each cross section, inside and outside bark.
3. Length of each log.
4. Length of top above last log cut, and
5. Height of stump. The total of these lengths will then give total length of the tree.

About 500 trees at least should be measured where timber is uniform. This will give good results for careful cruising, but when only a rough cruise is desired, 100 trees will suffice. Measurements should be made of the average trees of each diameter throughout regardless of total height. In other words, each tree should be a representative of its class. If 100 trees are to be measured care should be taken that the diameters are well distributed.

With the above data, the volume of each tree can readily be computed. To obtain the volume of a log, multiply the average basal area by its length—that is, look up the table of basal areas corresponding to the end diameters of your log, and multiply the average by the length. To obtain the volume of the cone, or top of tree above the last log cut, multiply its basal area by one third the altitude or length. The total of these figures will denote the cubic contents of your tree.

Now that the volumes of all the trees have been calculated, arrange them by species in diameter groups or classes and take their average. This is best illustrated by the following sample table:

Specie, Sugar Pine—Volume table of different diameters.

Diameter, class breast high (inches).	Average diameter of trees measured breast high (inches).	Number of trees measured.	Average volume of trees measured (cubic feet).	Average results of column 4 evened off by curve (cubic feet).
6	6.15	6	4.8	4.6
8	8.25	20	7.6	7.2
10	10.00	15	11.8	11.4
12	12.20	14	17.0	17.8

For convenience, a curve is now constructed, and is obtained by plotting the figures computed in columns 4 and 2 on cross section paper, as ordinates and abscissæ, respectively. So, for the final results in column 5, the values are read direct from the curve.

The volume table just described is only one of the many types which may be constructed. They are made to suit the purpose for which they are to be used. Other types which may be constructed are: Tables for trees grouped by diameter and number of logs and for trees of different diameters and heights, etc.

"Cruising" or "Estimating."

Volume tables are of aid to the timber cruisers in that they greatly simplify the computation of the contents of stands. When a lumberman or company buys a tract of timber or are going to log or sell, they usually wish to know beforehand how much timber can be obtained. This is done by cruising or estimating. There are many experienced loggers, land lookers, timber estimators and cruisers who make a business of determining the merchantable contents of timber tracts, and these men are so familiar with trees that determining the board feet in a single tree or giving an approximate yield per acre is second nature to them. Timber cruising cannot be learned from books, for it requires good common sense and judgment, which is obtained only through long experience and practice in the woods. A good cruiser is able to judge by the eye the merchantable contents of trees and stands, by having seen other trees and stands of the same character cut and used, and he knows by comparison, therefore, as to what they ought to produce. He must be familiar with logging conditions, with the defects of trees and the allowances necessary. He must know the cost of logging and other conditions existing in order to ascertain what trees are merchantable from the point of size and condition. For these reasons, and they are apparent enough, books cannot make timber cruisers or estimators.

There are several methods used by cruisers in estimating timber and only one, that used by the foresters, will be considered here. The old-time cruiser usually being in a hurry to get quick results and still accurate as possible, used his eye and judgment. However, this is not the case with foresters, for usually more data is desired and careful surveys are always made.

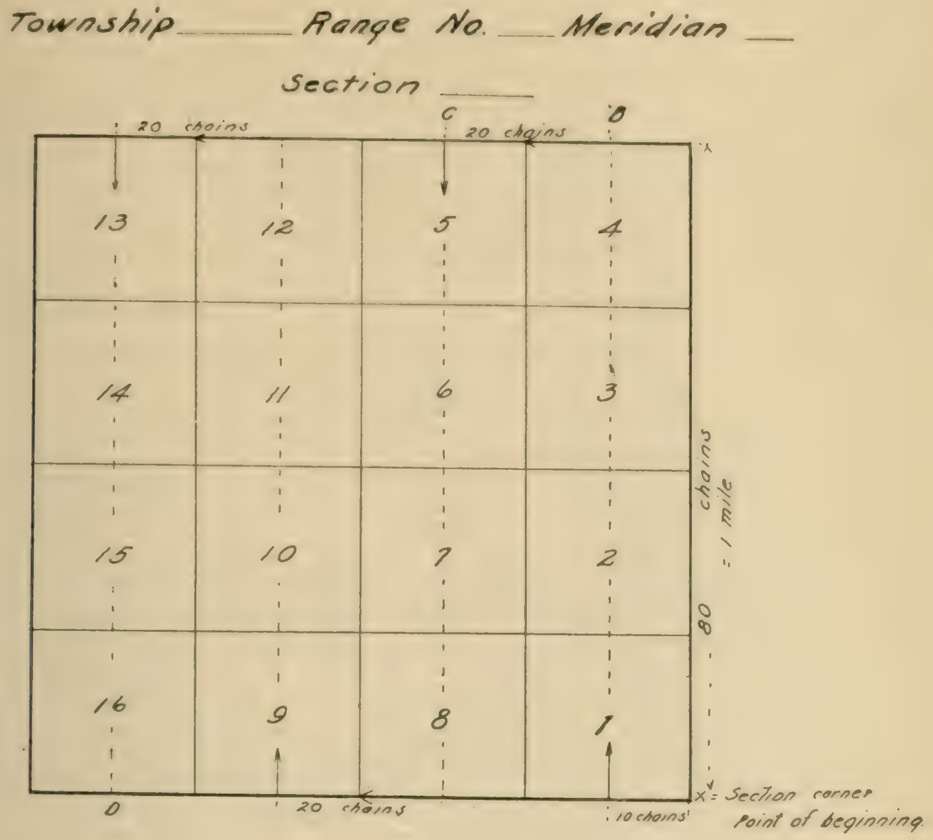
Following is their method, called the *Strip Method*, and it is considered an accurate one:

The principle underlying the use of strip valuation surveys is the measurement of trees in narrow strips distributed systematically over the forest and covering a specified proportion of the total area. In practice of the Forest Service, the strip surveys are one chain, or 4 rods wide, and 10 chains or 40 rods long, so each covers just one acre. If carried on in this manner, the tree measurements and forest descriptions of each acre may be kept distinct.

Four men usually constitute a crew, one man lays the direction of the strip with a compass and carries the forward end of of the chain, two men caliper the trees, and the fourth acts as tail chainman and tallyman; he also makes any necessary descriptive notes. The strip is measured lengthways—that is, stretched on the ground. The trees within an estimated distance of 33 feet (one half chain) on each side of the chain are then calipered and "called off" to the tally man, who records them. Then the crew moves forward another chain, repeating the process until 10 chains (one acre) have been measured. Then proceed until "forty" is finished, which is 20 chains or 80 rods, and then go on to the next "forty."

The Forest Service uses the strip method not only to obtain estimates of the merchantable timber, but also to secure a count of the trees not yet merchantable, to make forest maps and to gather other detailed information necessary to a practical working plan. Under these circumstances, lines of strip surveys are usually laid off parallel and equidistant, and run across the whole tract or as far as the day's work will permit.

The following figure is drawn to illustrate the procedure in cruising a section. It is customary first to locate the tract, which is done by resurveying and locating lines and corners. While carrying on this survey, notes regarding topography and the descriptions of corners found should be kept. Two men usually constitute a "line running" party.



A section contains sixteen "40's" or 640 acres, so for convenience, the "40's" are numbered so method can be followed.

Beginning at the S. E. corner of the section marked x, run a line 10 chains W., which will bring us to the center of the "forty." Now, run N. 80 chains through the "forties" numbered 1, 2, 3 and 4. Having arrived at B proceed to C and then go on as before, going through the remaining "forties" as numbered. When arriving at D in the "forty" numbered 16, run W. 10 chains to "tie in" with the section corner. The latter acts as a check against error in compass work and chaining.

Calipering the Trees.

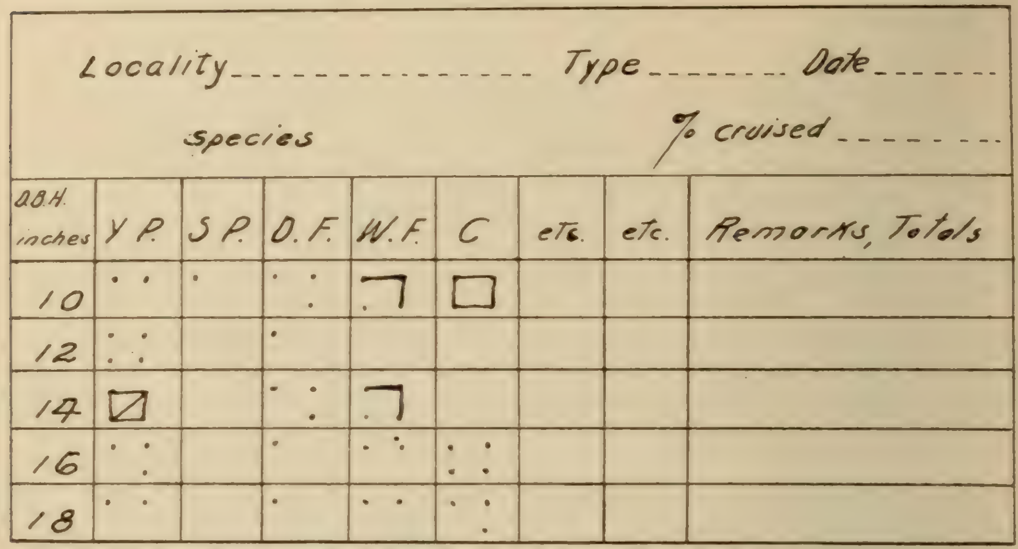
Trees are calipered to the nearest inch at breast high, or the trees may be divided into diameter classes of two or more inches. By diameter breast high (D. B. H.) is meant the measurement taken of a tree at 4.5 feet from the ground and one should be careful and not take diameters below D. B. H. In estimating merchantable timber, only the sound marketable trees are included, because many errors result from counting unsound trees. Great care must be exercised to scrutinize each tree for signs of defect. This is very important for many inexperienced and careless men will measure trees which may appear sound but which really are defective. A cruiser must recognize the external signs, of punk knots, white broken top, or dead limbs, for defects.

Recording Measurements.

The diameter measurements are recorded in a tally sheet note book, the tally sheet being ruled in columns: The first column shows the diameter classes by inches or by groups of 2 or more inches, and the other columns are for various species.

The trees are tallied by dots and lines, in blocks of ten.

Following is a sample tally sheet to show methods of tallying.



Locality................ Type........ Date.......

Species % cruised........

D.B.H. inches	Y.P.	S.P.	D.F.	W.F.	C	etc.	etc.	Remarks, Totals
10								
12								
14								
16								
18								

Computation.

Usually the sample strips comprise 5 per cent to 10 per cent of the total area and this fact must be borne in mind when computing the volume of a stand. For instance, if you were to make a 5 per cent estimate, you will have covered two acres out of each forty or 1-20 of the forty, therefore to obtain the volume of the stand, multiply by 20 if 5 per cent and by 10 if 10 per cent and so on.

The computation may very easily be made in the following manner. Make four columns of figures as shown in the form. In the first column place the diameters, in the second, the number of trees of each diameter, in the third, the average contents of trees of the different diameters, and in the fourth, the total contents of all the trees of each diameter, which is found by multiplying together the values in the second and third columns. The figures in the fourth column are then added together for the total contents of the "forty."

Sugar Pine			
D.B.H. inches	Number of Trees	Contents of Tree from Vol table	Total Contents board ft.
12	20	80	1600
14	10	135	1350
16	55	200	11000
18	6	265	1590
Total - - - - - -			15540

Note –
Sample plot, a 5% cruise therefore, the whole "40" will contain 20 × 15540 or 310,800 board feet or $\frac{310,800}{40}$ = 7,770 board feet per acre

Another method and one which does not involve the use of a Volume Table is the estimate by counting logs.

This consists in going over a given tract by strips 4 rods wide (one chain), and their distance apart will depend on the proposition of area to be covered. The estimated top diameter of each merchantable log is recorded as well as the D. B. H.

If a crew of two men, one directs the strip with a compass line and paces the distance, while the other records the diameters of trees and logs. The compass man first paces off a short distance, say, one chain and waits until the tally-man records the trees in that distance and included with a four-rod strip.

The tally-man records the estimated top diameters of each 16, 14 and 12 foot log, their numbers and species. The following table is one showing method used, when only 16 foot logs are considered. Other columns may be added at will to record 14 and 12 foot logs. This may also be done in case D. B. H. and numbers of trees are recorded.

From this data the total contents by species and yield per acre may be determined.

The compass man notes the distance paced, the location of roads, trails, fences, etc., and any other information desired in the cruise. These land features may later be plotted on a map.

Top diameter	Species				
	S. P.	Y. P.	D. F.	W. F.	C
	Number of 16' logs				
6	10		8		10
8					11
10	12	9	7		
12	10			9	12
14	16		6		14
16		5	4		16

Computation.

These notes or records will enable the cruiser to determine the contents of logs by any log rule. They will also give the total number of trees, the average number of logs per tree, the number of trees and logs per thousand and the yield per acre. This method is very good in that you can "cull" cracked and defective logs.

After the total contents have been determined, a certain percentage is deducted to allow for defects.

One must have the ability to estimate diameters by eye as well as have a thorough knowledge of merchantable timber to use this method. It requires a trained eye and in general a good woodsman.

Growth of Trees.

Yield and growth tables play an important part in the determinations which a forester must make. Their purpose is to ascertain the yield and rate of growth of a stand, for in many cases a timberman desires data on the future conditions of his timber.

Diameter of Growth.

Trees grow by adding a layer of wood underneath the bark each year. This growth is termed annual growth, but perhaps more commonly referred to as the annual rings. In many cases they are hard to distinguish making the use of a hand lens necessary. Each ring signifies a year's growth, and the spring and summer wood is different, making the determination of a tree's age comparatively easy. The total age of a tree is shown by the accurate counting of the rings at the ground. Therefore, to determine the age of a tree count the rings on the stump and add the number of rings corresponding to the number of years required to grow as high as the stump. An examination of a number of small trees would give an idea of the time required to grow up to the stump height.

Many trees grow faster on one side than on another, so to get the average growth, determine the average radius and measure and count the rings along it. Then with the rule, this average, (from heart to inside back) is found by trial and a penciled line made. Beginning on the outside, the rings are counted in and a mark made to indicate each tenth ring. Usually the last period at the heart (or pith) will contain less than ten rings. The rule is then laid alongside this radius and the distance from the pith to the first mark entered under 1 (in the following table) putting in the corner of the space the odd years, thus 8-9. The distance from the heart to the second mark is then placed under 2, and so on. The last measurement will be the entire radius and must be exactly half the diameter inside the bark of the tree.

It can readily be seen, that with this data, the diameter and growth per year, ten years or at any period may be determined.

Tree class Dominant, Quality I, Crown length 50, Crown Normal

Cross Section.	Distance on average radius from heart to each 10th ring—inches. (Count in, measure out.) 1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

1 Stump.																
2																
3																
4																

Remarks: Crown one-sided

Form and Condition: Cylindrical and vigorous

Height Growth.

The height growth is found by counting the rings at different sections (the different logs cut) and subtracting from the rings at the lowest cut. Remember to always add a number of years to cover stump growth.

For example: A sugar pine, 28 inches in diameter and 100 feet high, shows 170 rings on the stump 2 feet from the ground. Add 4 years as the time to grow these first 2 feet. This will show a total age of 174 years. The upper end of the first 16 foot long shows 160 rings; the second 150; the third 135; the fourth 115; the fifth 90 rings. The first 18 foot log (2 feet stump plus 16 feet log) grew in 174 — 160 or 14 years; the first 34 feet (2 plus 16 plus 16) in 174 — 150 or 24 years; the first 50 feet (2 plus 16 plus 16 plus 16) in 174 — 135 or 39 years; the first 66 feet (2 plus 16 plus 16 plus 16 plus 16) in 174 — 115 or 59 years. The first 82 feet (2 plus 16 plus 16 plus 16 plus 16 plus 16) in 174 — 90 or 84 years. The last 18 feet in 174—90 or 84 years. The last 18 feet in 174—84 or 90 years for their growth.

Volume-growth may be determined in the same manner as diameter-growth, the only difference being that the volume must be computed. In this way the growth for the last five or ten years may be determined and in case a future growth for this same period is desired, one may assume the volume in the immediate future to be the same as the last few years.

Another way of determining future growth in volume is to determine the growth in diameter at different parts of the tree during the last five or ten years and assume this growth to be the same during the coming five or ten years. By adding this growth and cubing it, you will have a tree to compare with your present tree. This method is not very accurate and will give too large results unless the volume growth is increasing.

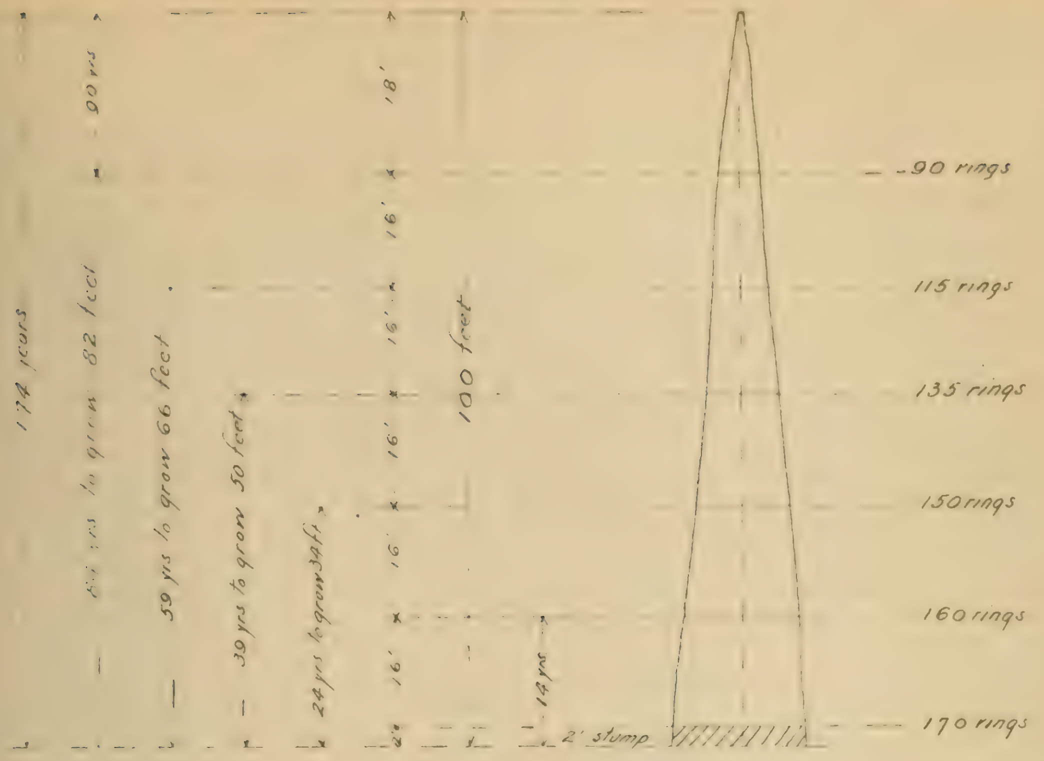

Figure for height growth

YIELD TABLES.

The construction of yield tables as described by Professor H. S. Graves of Yale University is as follows: First, construct for each forest type a table giving the average number of trees of different diameters of the valuation areas. This will represent an average of all the acres surveyed in a given type, and enables one to compute the volume of the merchantable trees above any desired diameter limit, with the use of volume tables.

The next step is to determine the future yield after lumbering. The table shows the number of trees now standing below the diameter limit. This portion of the table is corrected to show the number of trees which probably will be standing at the time of the second cut. One who has a knowledge of logging can easily see what corrections to make.

The table of growth of trees of different diameters is then used to determine the size of trees in 10, 20 and 30 years after cutting, assuming of course, in using the table that a tree of certain diameter will grow at the rate shown, until it becomes one inch larger and that it will then grow at a rate shown in the table for that larger size.

With the above principles in mind, a table is made showing the condition of the stand now, in 10, 20 and 30 years after logging. As an illustration, the following table is made and from which the yield table in its final form may be constructed.

An allowance is usually made for death during and after the first cutting of 5, 7 and 10 per cent in 10, 20 and 30 years respectively.

Computation of yield per acre. Cutting to diameter limit of 12 inches.

Diameter.	Present condition.				Condition in 10 years.				Condition in 20 years.				Condition in 30 years.			
	Number of trees	Volume average tree from volume table. (board feet)	Total volume (board feet)	Annual growth in diameter. (inches)	Diameter. (inches)	Number of trees	Volume average tree. (board feet)	Total volume (board feet)	Diameter. (inches)	Number of trees	Volume average tree. (board feet)	Total volume (board feet)	Diameter. (inches)	Number of trees	Volume average tree. (board feet)	Total volume (board feet)
6 inches	10			.10												
8 inches	7			.125									12.2	3.7	81	300
10 inches	5			.150									14.7	4.8	138	662.4
12 inches	3	81	290	.170												
14 inches	2	120	230	.185												
16 inches	2	175	208	.20												
18 inches	1	240	145													
20 inches	0.3	295	89													
22 inches	0.2	390	78													
Totals	30.5		1,040													962.4

Yield and growth tables, like volume tables, are useless unless used in the locality where made.

Instruments.

The field instruments of common use to the cruiser, or woodsman will now briefly be discussed.

The compass is the most important instrument and is used for running lines, taking bearings etc. in the woods. They vary in pattern and manufacture but the general principle is always the same, *i. e.*, that of having a magnetic needle always pointing in a northerly direction.

The chain, used in measuring distances when surveying, is 66 feet long (4 rods) and is made of 100 steel links, each 7.92 inches in length.

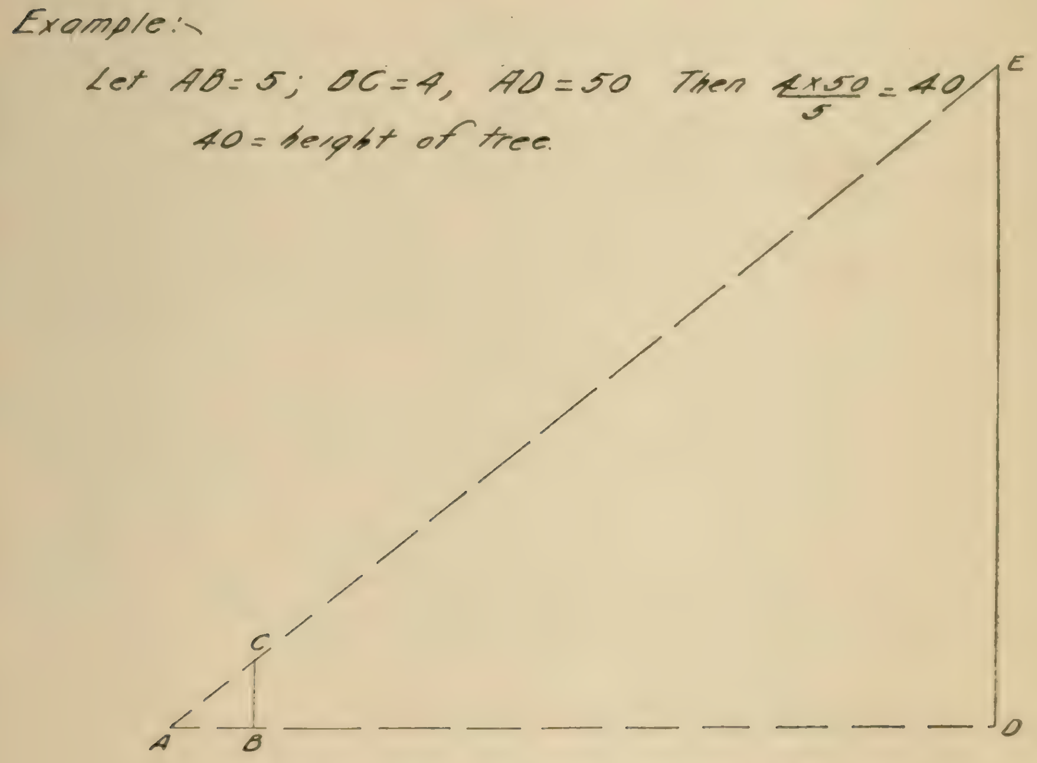
There are also tapes of different lengths used in measuring the circumference of the larger trees, such as the redwoods in California. The diameter of a given circumference may be read direct by reading the other side of the tape.

Calipers are used for measuring diameters, and consist of a beam having a scale on both sides, graduated in inches and tenths. This beam is provided at one end with an arm held in place by a bolt and nut which permit it to be detached for transportation. The beam is also provided with a sliding arm fitted loosely, so as to slide easily over it. To caliper a tree then, slide the loose arm sufficiently to permit measuring the tree. Calipers are usually made of seasoned maple.

Other instruments which are useful are height instruments, tree counters, increment borers, and so on.

A simple method of determining the height of a tree, without the use of a height instrument is as follows: The observer walks to a distance from the foot of the tree about equal to its estimated height. He then lies on his back, stretched at full length, and notes on a vertical staff erected at his feet, the point where his line of vision to the top of the tree crosses. The height of this point from the ground B C (in figure) is measured and his own height from his feet to his eyes A B.

Then $AB : BC :: AD : DE$ or $\dfrac{BC : AD}{AB} = DE$



Example:-

Let $AB = 5$; $BC = 4$, $AD = 50$ Then $\frac{4 \times 50}{5} = 40$

40 = height of tree.

Figure to illustrate the determination of heights without instruments.

CUTTING SYSTEMS.

Lumbering methods as carried on by the present day lumberman are known, from careful examination and study, to be very wasteful and devastating. As a result, the forester sees the need of a systematic plan of cutting or logging standing timber. He not only considers the easiest and most economic way of removing timber but has in mind the results of such a cutting, what the future forest will be like, what species he will have and the yield in salable products. For these reasons, Cutting or Sylvicultural Systems, which are plans of management by which forests are developed and produced, have been advocated. Those of importance, with brief descriptions, are as follows:

I. The Selection System.
II. The Clear Cutting System.
III. The Shelterwood System.

I. The Selection system is applicable to forests having trees of all ages. When cutting, the old and mature trees are selected, leaving the remaining immature trees for protection and development. Thus reproduction is readily secured in the openings made by the cuttings.

The Selection System never clears a stand, but makes only small openings. The principles, however, which must never be lost sight of and which would be simple, if all age classes were represented in proper proportions, are:

1. The rate of growth of a stand must be maintained, and
2. A proper representation of age classes must be continued.

In other words, some definite plan restricting the cut must be followed in order to make the system possible.

II. The Clear Cutting System takes place when all the trees are removed. The entire stand may be cleared in one operation or in several, but the design is to cut the whole stand and replace it with new growth. Some of the conditions requiring clear cutting are:

1. Where there is an even aged stand and the trees are large and mature.
2. When from a financial standpoint (location of logging camps, etc.) it is deemed feasible.
3. Danger from wind fall.
4. Where a clearing is necessary for good natural reproduction.
5. When better species than those in the original stand are desired and which can be obtained artificially.

Naturally, there are many disadvantages to a clear cutting system, such as leaving exposed to the sun and wind the young growth, insect damage, etc., but this all depends on the size of clearings, and therefore large clearings should be avoided as much as possible.

III. Shelterwood System: This system like the others is applicable in different forest types, according as the forests vary in age and reproduction capacity, but usually the method is best adapted to those stands in which the timber is all, or nearly all, mature, where the trees are wind firm and where market conditions will warrant the partial removal of the stand.

The mature stands require a system which will remove the timber in a certain period and replace it with a new even-aged stand. The selection system, therefore, is out of the question, as the principle underlying the Shelterwood System is to remove a stand gradually by a series of thinnings. The opening, in this manner, of the canopy permits the young trees to grow under the protective shelter of the trees left standing.

Many foresters and lumbermen agree that the best method is to remove the timber in two operations, separated by a ten or twenty year period. The first cutting or thinning is intended to secure the conditions required for reproduction and the next, or final cutting, is made after reproduction has been secured.

Some of the advantages in using this system are:

1. It permits the rapid removal of a forest.
2. The poorer grades and decaying timber are used.
3. Good reproduction is secured (insuring a good second cut).
4. The trees left standing will grow rapidly and will enlarge the second cut.

Reproduction After Clear Cutting.

Reproduction is obtained by artificial seeding and planting, or by natural reproduction. Usually, both methods are used: that is, natural reproduction replaces the original stand as much as possible and those areas having scant growth are filled up by planting. Ordinarily, the planting or seeding is done after and not before cutting.

The various methods of clear cutting are:

1. Clear cutting the whole stand.
2. Clear cutting in strips.
3. Clear cutting in patches.

1. Clear cutting the whole stand: This is the method which will be used in this country and consists in cutting an area clear and restocking it artificially. This method is to be used when the area is a restricted one or comprises a large stand of mature timber requiring several years to cut.

2. Clear cutting in strips: Consists in removing a stand by a series of clearings in narrow strips. After cutting a strip it is planted, and after being fairly established the next strip is cut. Thus, no large clearings are made and the young growth is offered protection by the neighboring trees.

3. Clear cutting in patches: Small clearings, regardless of size or shape, are cut in the stand and restocked artificially by this method. From time to time, the clearings are enlarged by strips surrounding these patches and then restocked by planting, continuing with this process until the entire tract is cleared. This is a European method and one which will not be used very much in this country. However, oftentimes this principle is used in combination with the other systems mentioned.

It is often advisable and essential, especially where natural reproduction is to be depended upon, to leave a few scattering seed trees.

Coppice System.

A stand is usually cut clear and applies to species which sprout vigorously after cutting. Reproduction takes place by sprouts from the stumps.

The trees which are most commonly adapted to such a system are: Willow, eucalyptus, maple, birch, ash, chestnut, redwood, basswood, locust, oak, and other hardwoods.

The system is very simple and inexpensive since no skill is required in choosing trees for cutting and reproduction takes place as a matter of course, abundantly and immediately after cutting.

The cultivation of willow is a good example of coppice, and may be handled in a very short rotation.*

BY PRODUCTS.

There is a large amount of waste in the conversion of timber into lumber, ties, and so on. In fact, it has been estimated, approximately, that only 50 per cent of a tree ever goes into merchantable form under present lumbering methods. Manufacturers as a rule try to save and utilize all of a tree that is possible by using fine saws and the most modern improved machinery, but even with such methods, a large amount of waste must necessarily arise. To use this waste profitably, is one of the most important problems now before the manufacturer. Undoubtedly, some day, nearly all the waste which cannot be worked into some form or other will be utilized by chemical means. Those most impertant now are the destructive and liquid distillation and the pulp industry.

In the Lake States, where in past years so much waste has been produced, numerous experiments have been made with respect to the manufacture of turpentine from Norway pine stumps. The results of these experiments have been fairly successful and improvements are continually being made.

In the distillation of hard woods small trees, limbwood and tops are used. Thus a great deal of the so-called "slashings" or "brush," which are always a fire menace after logging operations, are done away with.

The products from hardwood distillation in their order of importance are: charcoal, wood alcohol, gray and brown acetate of lime, tar and oil. The wood alcohol and acetate are by-products that can be saved only by the use of the most improved processes of distillation—that is, the using of air-tight retorts and the carbonization of the wood (charcoal) by indirect application of heat.

Charcoal, however, can be obtained by almost any carbonization process. At present, in Michigan, most of the wood is carbonized in kilns, in which it is placed and fired directly. With these conditions 4 to 6 gallons of wood alcohol per cord and a small percentage of acetate are saved.

In the distillation of pine two processes are in use, the destructive and steam distillation. The former is similar to that of hardwood distillation in that the wood is carbonized and in this way drives off the oils. The chief products thus obtained are turpentine, tar, charcoal and oils.

---

*"Principles of Handling Woodlots," by Henry Solon Graves, is recommended to those desiring a more detailed discussion of Forestry. It was consulted freely in preparing the foregoing.

Steam distillation consists in chipping the wood and then boiling it with live steam. The products contained in the wood are distilled with the wood and come off readily, while the wood itself is not carbonized as in the other process, but is left as a pulp and is used now chiefly for fuel. In the region where Norway stumps are being used, this residue is being experimented upon for its paper-making qualities. So far the results have been fairly satisfactory, and if successful from a commercial standpoint will mean one more important utility for waste.

The products obtained by this method are turpentine and heavy oils. Several of the latter have no commercial value as yet, but the turpentine when refined is considered about equal to gum turpentine and superior in some respects to the turpentine obtained by the destructive distillation of pine as carried on in the South.

Operations at present are confined chiefly to the long-leaf pine belt where the pine gum is obtained, in the states of Alabama, Florida, Georgia, and North and South Carolina.

However, besides the operations that are being carried on in the Lake States on Norway pine stumps, experiments are also being made by the Forest Service with Douglas fir on the Pacific coast. This is of great importance to this region for it will mean not only the utilization of a great amount of waste material, but will provide a market for an entirely new product.

In past years, sawdust has been produced in immense quantities; in fact it is being produced now on the Pacific coast and apparently has no use. Several manufacturers use a small percentage for fuel and in the East these huge piles are being bought by ice companies for ice-packing purposes.

Undoubtedly in the near future, a great deal of this waste will be used in the manufacture of a wrapping or other paper, since the use for ice packing is fast disappearing. Modern ice companies are manufacturing ice artificially as the market may demand and the harvesting, storing and shipping of ice in sawdust as is still being done in many of the northern states is unnecessary.

The above mentioned are only a few of the waste uses and there still is a vast field for improvement. Slab and bark waste, species which can be used for tanning and the waste in lumbering, cutting trees (leaving high stumps), must also be considered.

WOOD PRESERVATION.

In recent years, this question has become an important one to wood users in the country. Especially is it of importance to those using timber for telephone and telegraph poles, fence posts, railroad ties or for other purposes where the timber must come in close contact with the soil. Timber of desired species for these purposes is getting more scarce and rising in value every year, thus necessitating some means of prolonging the life of wood. The different wood using companies are realizing this fact, and some are carrying on experiments for this purpose. Their experiments up to date consist in applying preservatives.

It is a well known fact that thoroughly air dried timber will not decay, because it does not contain sufficient moisture to support the growth of fungi and wood boring insects which are the causes of decay. On the other hand, if the timber is placed in the ground, that portion of it in close contact with the soil will absorb moisture until conditions favorable to decay are restored. To prevent this decay in timber so exposed to moist air and soil, the wood substance, which is the food for fungi growth, etc., must be made immune from such attack. This is accomplished by injecting antiseptics. The value of such a treatment consists in providing an outer protective covering around the untreated interior wood and should penetrate deep enough to prevent exposure.

By the application of preservative treatment, many species of timber not naturally durable and formerly not considered suitable for poles may be used for this purpose.

Treatment.

Creosote seems to be the preservative best adapted to treating woods and this treatment is based largely on the pressure method, where 8 to 12 pounds or more of creosote to the cubic foot of timber is used.

Experiments conducted by the Forest Service show that best results are obtained by first carefully seasoning the timber. Seasoning, therefore, is an important factor and the rate of seasoning will depend largely on the season of the year in which the timber is cut. If seasoned too rapidly the timber is apt to check, whereas timber seasoned slowly and evenly forms numerous small checks, which close again when absorbing the moisture. Checks, therefore, decrease the strength of timber and hasten the rate of decay.

Serious damage from large checks may be avoided by the use of "S" irons.

There are two methods of treatment as applied in preserving poles, these are:

1. The brush method.
2. The open tank method.

1. The brush method consists in applying the preservatives to the surface of the wood with a brush. This form of treatment gives fairly good results but still does not present a complete solution to timber preservation. This method costs but little, in that it needs no expensive apparatus to operate; and again, but little preservative is required.

In the experiments carried on by the U. S. Forest Service, a penetration of from one eighth to one fourth inch was obtained in seasoned timber. In all cases the preservative was applied hot.

Directions for applying preservatives: Fill all season checks with the preservative to guard against decay.

Only poles which are thoroughly seasoned should be treated.

The butt only is treated since it is the portion most subject to decay.

Do not apply the preservative to poles which are wet or damp.

Better results are usually obtained by heating the preservative before applying.

2. The open tank method consists in subjecting the timber to successive baths of hot and cold preservatives. This method like the brush method has the advantage that the preservative may be applied to the butt of the pole only. This avoids the expense of applying it to the portion above ground, which in many cases is durable without treatment.

The three general methods of applying the preservative are:

1. After the timber has been held in the hot preservative for the required length of time, the heating may cease and then allowed to cool.

2. The timber may be transferred from the hot liquid to another tank containing cooler preservative.

3. The preservative may be changed, the hot being drawn off and the cold run into the treating tank.

The open tank method is unlike the brush method in that it is an impregnation process and not a mere coating of the surface with preservatives. This absorption usually takes place during the cooling process, while a hot bath prepares the wood for treatment. The drier the wood the shorter the period of hot bath needed.

These tests were applied to several species of timber, chief among them being chestnut, southern white cedar, western red cedar, lodgepole and loblolly pine. In one instance an untreated pole of southern white cedar showed decay at the end of four years while a creosoted loblolly pine showed no signs after 18 years of service.

There are various preservatives now in use and for general information, a few will be mentioned. They are, tank treatments with—

1. Creosote.
2. Creosote and zinc chloride.
3. Zinc chloride.
4. Crude petroleum.

The Forest Service found after carefully testing with them all that creosote was best. They also came to the following conclusions:

Seasoning of poles reduces the weight 16 to 30 per cent.

Poles cut in the spring and summer lose weight most rapidly.

Of the two methods, brush and open-tank, the latter is best and more thorough, since it prolongs the life of timber for a longer period than the brush method. However, the brush method is inexpensive and with a good preservative may be expected to prolong the life of a pole two or three years.

Finally, it pays to treat timber. There are good grounds for this last statement and for example we will mention a condition existing in Michigan. Here, the railroad companies have been using cedar ties for many years. The cedar supply is now nearly exhausted and for this reason the railroads are buying all the available hard wood ties and treating them with creosote.

A more detailed discussion on wood preservation may be obtained from Forest Service Bulletins numbers 78 and 84.

The question of tie preservation is becoming more and more important as the demand for tie material increases. So long as plenty of white oak ties could be secured the necessity for tie preservation was not felt, but with the constantly increasing use of pine and other woods less resistant to decay, it has become a problem worthy of consideration. The railroad companies have faced the problem by establishing treating plants, and by laying experimental tracks with treated ties to determine the quality of the several preservatives under different conditions.

CHAPTER VII.

A STUDY OF STREET AND HIGHWAY PLANTING.*

(Progress Report.)

At first thought it might seem that the question of "Street and Highway Planting" might be somewhat removed from the general work of the Forestry Department. But that this is not the general opinion of the public, can easily be shown from the great number of queries along this line which are constantly coming into this office. These queries, of course, cover much ground and very often the material needed for a reasonable answer is not at hand or well organized.

Because necessity has demanded that something be done and because popular opinion has turned to this office for help, this study has been undertaken. It has been the first object of the study to gather material throughout the state, and so far the Bay region, Santa Clara Valley and southern California have been studied. This material, of course, has come from many different sources. Many men and women have contributed the fruit of years of work along private and civic lines that we may have the data for general distribution. To them, individually and collectively, we give our heartiest thanks.

Certain fundamentals were always investigated. For each town a species list was kept, in which were noted the trees which commonly occurred in the parkings and any others which in any way appeared as possible candidates or which might have been recommended, whether wisely or not, to our judgment. With each list general notes were taken which contained items concerning their habit of growth, rate of growth, their resistance to drought or alkali, their need of care, peculiar phases of pruning or culture, their needs on the average street and many others which might concern all or particular species of trees. Many of these have been contributed by individuals who have made a study of the trees in their locality and this has been noted, as these matters do not always hold in all vicinities though they may be quite near each other.

Where it has been possible, these facts have been reinforced with photographs with varying success, as some things appear fairly well in a gray and white reproduction which, in reality, are not attractive in any degree.

To some extent, lists of nursery people have been kept from the various towns; these will be filed in the office and may be of help in some cases though the nursery situation in most places is not a serious one.

In each town all these features have been noted, and where it was possible, the problem has been studied from the viewpoint of the officials in charge. In cities where this work is well in hand, the matter has been entered into at considerable length and in those places where it is as yet in its infancy, the general conditions and problems have been studied as they would confront the official undertaking the work. In some cases, as a stranger, some features have been noted not generally thought of but in most cases it has been deemed more discreet to offer the judgment of those who have actually accomplished something, rather than any arbitrary statements from a superficial visit. And by a superficial visit is meant not a light study of the problem, for it has been undertaken in all seriousness and earnestness, but less mature conclusions than could be offered by one who has been on the ground for years and seen the development. And from all our study has come one chief aim (and this, it is hoped, may be a chief result of the study), and that is, consideration and adoption of civic control of municipal planting.

Throughout southern California there is a growing knowledge of the matter of municipal control of street planting. Those cities which have tried the system have shown that great things can be accomplished. Of course the returns of these efforts cannot be directly measured in dollars and cents as the average citizen would perhaps desire, but their return is just as certain though perhaps less noticeable.

At Riverside, the pioneer city in this work, there is a real civic pride in what has been accomplished and justly so. The management at Riverside has been far-sighted enough to improve the parkings uniformly and not pay undue attention to the fine boulevards and wealthy residence streets to the exclusion of the more modest places. With what result? Simply this—that one can go street after street and see almost no cases of unimproved property. And if one should question some householder any objection would be the exception which would prove the generalization, that most of Riverside is pleased with what has been done, and more than proud of its position among the leaders. For, of course, Riverside is not alone. Redlands, Pasadena, Corona, Alhambra, and many other towns have profited by the experience of their neighbor and have gone and done likewise.

---

*Final results will be published in bulletin form when the study is completed.

And in those cities which have not entire control of the trees, there was never a lack of information or interest in the subject. In some places the problem is a serious one and one which cannot be undertaken lightly. The realization of this fact is proof that these cities have considered the matter in the right spirit and are going to do the best that is possible when they begin their work.

Riverside, which has been doing systematic planting for many years, both under individual and community effort and in later years under city control, has perhaps the greatest number of trees planted. Pasadena follows closely with many fine plantings. Redlands, which took up municipal control but a few years ago, has made a fine beginning in the work and can boast considerable progress both in new plantings and the rejuvenating of the old plantings fallen into decay. At Santa Barbara there is a lively interest in the matter but as yet the general public spirit is unwilling to give up its individual power into the hands of any board. Certain steps have been taken which give the Commissioners negative powers which are more than useful. At Los Angeles there is no particularly vigorous ordinance and no very rigid enforcement of those existing. As to systematic planting—there is no work done by the city but considerable done by real estate firms. This brings about unfortunate results in many cases, as the selection of species, methods of planting, etc., are not always conducive to the best results. This matter is being pushed, however, both by some of the city officials and enterprising private citizens and many of these hope soon to overcome popular prejudice and gain a desirable ordinance. In San Diego, matters are in a very unfortunate state. Owing to soil conditions and other matters, it has been demonstrated that adequate and sufficient planting would mean a matter of considerable expense to the individual if assessments were made to the property holders. No satisfactory solution of the matter has as yet been worked out.

It should be noted at this point that both Los Angeles and San Diego counties are doing considerable and excellent work along the highways and roads of the county.

As these cities have been visited data has been gathered concerning all the species of trees found growing there which by any chance ever occur in any of the parking spaces. With this data, the opinions of various nurserymen, city officials, horticulturists, and other interested parties have been gathered concerning their personal opinions of each tree. Of course, there is considerable opinion concerning all the points. However, it is our hope to present this data in such a form that intending planters will have tabulated for them opinions of men who have done things. Then by a study of the existing conditions in their own locality and a comparison with those of authority, they may judge whether such a dictum shall hold for them or no.

Also, we have gathered together such information as we could concerning special features of planting or care after planting which have been worked out by officials in different parts of the south. For these we have to thank many interested people who have given freely of their time and of their supply of results to aid this work. To name them all would be tedious to the reader, but they will be certain that their enthusiasm and unselfishness is rewarded in the progress of those around them.

Aside from the work which has been done there will be included a series of suggestions gathered from the experience of Eastern cities. As these conditions are not our conditions, these suggestions are not recommendations, but are merely ideas submitted for consideration. As to whether there is need for them or whether they are worthy of consideration—that is a matter which every municipality must put into competent hands. Some matters which are of prime importance in some localities, sink out of notice in others. This matter of careful and intelligent consideration of local conditions cannot be too strongly urged or too often reiterated. Perhaps in this one factor will lie the entire success or failure of the work done in any one place.

With the eastern material will be some of the legislative acts which have been passed both in the states and in the various cities. In contrast to these we have gathered some of the city ordinances found among the cities visited. Several of the ordinances in use are very good and have proven most satisfactory, while others are indicative of the incomplete state which is to be found in those cities.

In all of the cities visited there was a cordial reception of the idea of a systematizing and collecting of practical data and in each place a real effort was made to show what had been most successful. In addition to the study of the actual planting and caring for the trees, there have been found other short cuts such as municipal nurseries and municipal woodyards. These both have been tried with varying success. The former finds naturally considerable competition and opposition and the latter, so far as discovered, has proven uniformly more popular.

Of these matters more will be said later. And of these matters and all others reported, it is hoped that it will always be remembered that the information offered has been gathered from many different sources. Much of it has been demonstrated and proven whether good or bad; considerable is open for discussion; and much more which is merely tentative. This subject is a growing one and like all others its first years are beset by many difficulties and dangers. It is hoped by this collection of material that some of these dangers may be avoided in the future; that any tendencies which may mature disastrously may be noticed now and checked in their incipiency; that a more common fund of information may be supplied to all interested parties and that a more intimate relation may be built up among those whose endeavors are related.

It is to be hoped that whatever the strain put upon personal feelings in the working out of these "more or less esthetic" phases of municipal life, that those, whose best judgment is in reality the best, will exercise all of their powers to build up a sane public opinion concerning these matters and with a patient effort through a varying length of time build up a spirit which will fruit in civic pride and desire for civic beauty. Southern California has this spirit; do what you can to help it on in your neighborhood and do not hesitate, but push on to the ideal.

CHAPTER VIII.

CONTRIBUTED PAPERS.

Forestry Subjects Discussed by Members of Clubs and Associations.

Such genuine interest has been evinced by the members of various Women's Clubs throughout the state that an opportunity was given them to express their views, through the medium of this report, upon subjects relating to forestry in which the particular person or branch of the club was interested.

A similar opportunity was given to the various associations organized in this state for purposes of forest protection, or for furthering the interests of forestry.

I take pleasure in presenting to the reader the following articles which have been so kindly prepared for this report. I also desire to thank those who contributed the articles, and for their interest and coöperation.

HISTORY AND ACHIEVEMENTS OF THE STOCKMEN'S PROTECTIVE ASSOCIATION.

By JOHN J. CALLAGHAN, Secretary.

Early Local History.

Organized efforts to better the conditions of any portion of the populace produce missionaries who aim to spread their tenets to all whom their efforts may reach. While the notes that follow may, in a sense, be a reflection of personal views, it is my hope that they may in some measure assist others working along similar lines.

We will concern ourselves with that section of the Coast Range lying between Mount Diablo in Contra Costa County and Mount Oso in Stanislaus County, and bounded on the west by the Bay of San Francisco and on the east by the San Joaquin Valley. Fully one half of this district has been devoted to the raising of live stock from pioneer times. Until the advent of the railroads, the occurrence of range fires was very infrequent, although forage had accumulated after favorable seasons. With the great increase of population in the bay counties in recent years and the advent of the care-free hunter from the nearby towns, the menace became intolerable and many range men thought to abandon an uncertain means of livelihood.

A denuded range, with timber, cordwood, fences, dwellings, and forage swept away in a few hours time, will not in this section of the State produce under normal conditions, an average blanket of grasses for fully three years—certainly no profitable investment. Some few years ago during the summer nights, the residents of the valleys and towns could frequently view long lines of fires sweeping over the ranges, like battle scenes; beautiful panoramas, but as I will later demonstrate, injurious alike to them and the range owners. Lacking organization, the ranchman would wait until a wall of fire bore down on his holdings and then would make spasmodic efforts to check it's course, often without avail.

Local Stockmen Organize.

On May 15, 1904, a number of stockmen from Stockton, Pleasanton, Midway, Tracy, and Livermore met at the latter city and organized the "Stockmen's Protective Association," as its by-laws soon after adopted very aptly state, "*to promote the stock and range interests of its members, especially for protection against range fires.*" Although members have been assessed but one dollar a year, the association to-day represents over 250,000 acres of land in Alameda and San Joaquin counties and an investment of fully $3,000,000. Officers have since been elected annually and competent committees have achieved splendid results in many measures undertaken.

A spirit of coöperation within the ranks of members boded well for the young organization. The poor homesteader and large landowner have worked in harmony for a common cause, and, I make no idle boast in saying the personal differences in other matters have not entered here. They are builders looking for definite results.

The Policy of the Association.

The association has from its founding until the present time positively prohibited hunting, camping and trespassing on the lands of its members during the dry season. A uniform form of notice is posted, and, in places has been translated to a foreign tongue. The committees on by-laws and legislation have always secured the assistance and coöperation of the State Forester and the various county boards of supervisors with whom they have had to deal. Committees appointed to investigate fires have, by vigorous efforts, collected many thousands of dollars in damages for members without resort to legal actions.

Local Coöperation.

It is at all times unpleasant to tell your banker, your grocer or other business associate that he can not hunt or camp on your range, though he be most careful in the use of fire or firearms, yet, to maintain a necessary policy, no exception can be made; but, on the other hand, the banker should realize that the rangemen must prosper that he may pay his loans and increase his deposits. So, too, that grocer can not do otherwise than assist that hillsman so that his credit may be good at the store.

As the business community is mutually dependent, therefore, assistance should be given the rangeman to improve the conditions of his business. We increase the volume of trade and aid the entire community by such unity of action and mutual aid.

The clubs established in the hill sections by business and professional men of neighboring cities post notices that their guests may not trespass on our ranges. In line with its policy to promote local industries, the Livermore *Herald*, edited by Arthur L. Henry, has given our work such publicity that from that source alone the local public generally has been brought to a realization of the difficulties that beset us.

Fires and Insurance.

Work directed in turn by State Foresters Allen, Lull, and Homans, has reduced range fires locally to a minimum. All parties recommended by the association in Alameda, San Joaquin, and Stanislaus counties, have been appointed State firewardens by these officials. Blasting operations have been supervised and burning permits granted.

Though our members have secured thousands of dollars in settlements of damages for fires leaving the railroad right of way, we find it far more expedient to compel railway corporations to burn their right of way than to await the outcome of controversies with claim agents.

As a result of the rigid patrol, backed by State and county and the good will shown by citizens generally, some standard fire insurance companies write policies on grazing lands in this section. With the protection afforded, they rate the risk a safe one and a good investment, and fully 75,000 acres of land are now insured.

Mounted Patrols.

Five mounted patrolmen cover this district at the present time, reporting regularly to the county firewardens and the State Forester. The men were recommended for appointment as county and State firewardens by the association, by ballot of members.

Realizing that the closing of our ranges resulted in the propagation of deer and valley quail, the State Fish and Game Commission has, as well, appointed them deputy fish and game wardens. These men report daily at certain designated stations.

Legislative Measures.

Committees have approached the boards of supervisors of Alameda and San Joaquin counties, petitioning for appropriations for a system of fire patrols. The demands have been made from an economic point of view and coming from a large body of taxpayers, the officials have realized that such appropriations were good investments of public money. The necessary grants of funds have been made, thousands of dollars' worth of assessable property has been saved from destruction and live stock has remained in the counties interested, to be again assessed and add to the volume of trade.

Coöperative Measures.

Some days since, President John McGlinchy of the association received from the Oakland Chamber of Commerce a tender of any services that could be given and a request for the association to reciprocate. I can not impress too strongly the value of unity of action.

I believe that associations of range owners should be instituted throughout the State. Each unit could be a county or two. Local and topographic conditions would define the area that might be covered, and yet, not prevent concerted and effective work. Such associations could federate in due course.

I would strongly urge interested communities to coöperate with the State Forester's office in order that some uniform scheme of statewide organization may be effected, as well as with the various county officials. Such a scheme could only result in harmonious action in accord with conservative legal procedure. Where county revenues are insufficient for this purpose the State Forester should urge the necessary legislative appropriations.

In Conclusion.

While there are 27,000,000 acres of Federal lands in California, the lands under State control are equally extensive. The industry that produces the meat products required by our people should, for the well-being of the commonwealth, be better organized along these lines. While some good is being done, we lag far behind other elements of the people. Legislators and thoughtful citizens who would deal with the conservation of water and forest should likewise, as trustees for the generations that follow us, safeguard our highly valued brush and meadow lands for their peculiar uses.

TRI-COUNTIES REFORESTATION COMMITTEE.

San Bernardino, Riverside and Orange Counties, California.

By FRANCIS J. CUTTLE, Chairman.

This committee is composed of twelve representative men from each of the counties of San Bernardino, Riverside, and Orange. It was permanently organized in January, 1907.

The purposes of the organization are as follows: "To diminish the winter and spring run-off and increase the summer flow of water from the San Bernardino watershed—

First—By securing to the Federal Government the ownership of all lands within the outside boundaries of the San Bernardino Forest Reserve.

Second—By preventing the further destruction of timber and brush within the said reserve.

Third—By reforesting all denuded areas.

Fourth—By afforesting, where practicable, all areas not now covered with sufficient timber to conserve to the best advantage the precipitation falling on the said reserve."

The organization is the outgrowth of a movement among the chambers of commerce of the three counties above mentioned to prevent the destruction, by fire, of the chaparral and other growth on the watershed from which these counties secure water for domestic use and irrigation. Before the permanent organization was effected, a committee had been appointed by the Riverside Chamber of Commerce to secure coöperation between the water users and the Federal Government for the protection of the watershed from fire. Through this committee, since its organization, the people who secure water from this source of supply have been and are now in constant touch with the Federal and State authorities who have charge of this watershed. During the past five years nearly $50,000 has been expended in the construction of fire lanes and trails for the purpose of enabling the forest rangers and auxiliary forces to patrol the watershed to prevent forest fires or extinguish them in their incipiency. The expense of doing this work has been largely paid from the Federal and State treasuries, although the committee has raised some funds toward this work and at the present time is paying the salaries of two extra forest rangers to secure better patrol of this watershed during the dry season. Only one disastrous fire has occurred during the past five years, and fortunately that was on a portion of the watershed from which the least amount of water is secured for domestic and irrigation purposes.

Committeemen from each county are selected to serve one year or until their successors are elected. Meetings were originally held four times each year, but during the past year this has been changed so that three meetings are now held each year, one in each of the counties having representation on the general committee.

An auxiliary organization, known as the Water Conservation Association, has also been perfected through the work of this organization. It is incorporated under the laws of the State of California and has the power to purchase real estate and carry on general business of a water company. Since its incorporation this association has purchased about 600 acres of land, or rather, gravel and boulders, and has secured the withdrawal, by the Federal Government, of about 1,100 acres more in the gravel wash bed of the Santa Ana River, immediately outside of the National Forest, where the fire lanes and trails above referred to were constructed. These lands lie at the base of the San Bernardino Mountains. On this 1,800 acres of land a very complete system of open ditches has been constructed for the purpose of distributing storm water during the season of run-off which occurs in this locality from December to April first. These lands are located from four to five miles due easterly from the San Bernardino artesian basin and from 400 to 500 feet above the basin. The sinking of water on this débris cone has been carried on for the past six or seven years, although only on a large scale for the past two or three years, during which time about 10,000 inches of water is sunk each year for probably a hundred days. This work has been carried on long enough to bring about very definite and beneficial results in augmenting and sustaining the flow of water from the streams having their rise in the San Bernardino artesian basin, and also from artesian wells. During the irrigation season of 1911 two companies having their source of supply in the San Bernardino artesian basin secured approximately 1,000 inches more gravity flow than prior to the sinking of this water on the débris cone, and that, notwithstanding the fact that the rainfall had been decreasing for four or five years preceding the summer of 1911. The stream flow, as well as the artesian flow from the easterly portion of the San Bernardino artesian basin, has been remarkably good for the season of 1912, although in the northwesterly portion the water has been very low, indicating that there may be some underground barrier between the easterly and westerly portion of the artesian basin preventing the westerly portion from receiving benefit from the spreading of storm water on the débris cone on the easterly portion. This, of course, is only a supposition. This project is now being thoroughly investigated by the Federal Government at the request and expense of the State Conservation Commission, to ascertain definitely and authoritatively just what benefit is being derived from the spreading of this storm water. Practically, the people who are carrying on this work are thoroughly satisfied with the results. These people are a unit in their desire to have better protection from fire on the watershed from which they secure their supplies.

Attempts have been made at reforesting and afforesting areas on the south slope of the San Bernardino Mountains, but so far without any marked success. Indications are that very little large timber has ever grown on the south slope of the San Bernardino Mountains, it being covered with a dense growth of chaparral. Investigations are also being carried on to ascertain the amount of run-off on that portion that was burned over during the immediate future years. This will be compared with the run-off after the watershed has been naturally covered by a growth of chaparral, such as existed before the fire. This, of course, will take a series of years to determine whether or not the chaparral prevents the rapid run-off of precipitation at the time it falls, and if so, to what extent, but it is believed that the expense of carrying on these experiments may give some definite information on the subject that will justify the experiment.

In closing, it might not be out of place to mention that since the great fire of 1911, which burned over approximately 12,800 acres, contracts have been entered into between the Forest Service and water companies and other organizations in the neighborhood, whereby these organizations maintain supplies and furnish, on an hour's notice, from 25 to 50 men each to fight fires in case of emergency. During the past year a portion of these emergency forces have several times been called upon. They have responded with such promptness and good effect that several fires which might have grown to disastrous proportions have been put out immediately after starting. Auto trucks are used to take these men and supplies to the scene of action and the plan seems to enable the Forest Service to have at its command reliable working forces almost as promptly as the chief of a fire department in a city can summon the firemen to the scene of the conflagration.

CLUB WOMEN AND FORESTRY.

By Mrs. Foster Elliot,

State Chairman of Forestry, California Federation of Women's Clubs.

When first beginning the study of forestry in connection with Club work, one is fairly overwhelmed with the immensity of the subject, and feels perchance a touch of reproach at one's temerity at even approaching this great line of work.

This feeling soon passes away, however, and the more one studies into this great question, the more interested one becomes, and believes that small endeavors from each section, united in one great activity, give untold help to the whole Forestry movement.

Surely this great movement for forest protection is one of the most important of the problems before the American people to-day, and our future welfare depends upon its working out. As women are vitally interested in all questions that affect the home, they fully realize "that almost every industry is controlled by forest preservation; useful, ornamental and industrial arts depend upon the output of the forest. In this line of work, woman proves she can reach a result as quickly by reason as by intuition, and her influence is felt everywhere in this movement in civics and forestry."

The Conservation Department has become one of the most important in our great federation. At first it was called "The Forestry Committee," being organized to help along the forestry work, and for some years labored along that one line. Later, the preservation of bird life entered into the place, because of its close relationship to forestry. We have a saying "No birds, No Forests; no Forests, no Birds." Again, later, at the suggestion of the Woman's National Rivers and Harbors Congress, a waterways department was added, and two years ago the name was changed from Forestry Committee to Conservation Department, and, ever since, these two great issues have gone hand in hand.

Perhaps nowhere in the United States is the welfare and prosperity of the people so dependent upon the preservation of the forest cover as here in California. California has always suffered from forest fires. The Indians, sheepherders, settlers, and campers have all been responsible for the forest destruction. Some time ago a series of dry years, accompanied by disastrous mountain fires, brought the people of California to a realizing sense of the danger to the water supply, and consequent check to the growth and development of the country, unless proper means were taken to stamp out the recurrence of mountain fires. For many years an active educational campaign in the interest of conservation has been carried on.

In this great work the club women of California have done their share. While many live in cities, still more live in small towns, or on ranches, but wherever they are, they know and believe that wood is one of the prime necessities of man and "We must save the forests."

The club women of California count no small part of their work to have been along the lines of education; perhaps we will never know just how far-reaching it has been. The successive state and district chairmen have given freely of their time and talents, have addressed clubs and schools, written thousands of letters, distributed literature, written articles for the newspapers and in short have done all in their power to stimulate interest in forest preservation and water conservation.

This last year much instructive work has been done through the medium of talks illustrated by lantern slides loaned by the United States Forest Service. These slides have done untold good, especially among the school children, the pictures showing most widely the economical value of forests, their protection, esthetic and sanitary influences, waste and destruction in the forests, and what is being done to remedy these conditions. These slides were shown at the Whittier State School, and the close attention paid, makes us hope that the girls and boys will receive lasting benefit. Everywhere the emphasis has been laid on the need for fire protection, and during the coming year the slogan will be "The Necessity for Fire Control."

Through the strenuous efforts of the Women's Clubs, in many sections, valuable trees have been saved from destruction; in others, planting of roadside and school grounds has been carried forward and encouraged—parks planted to trees and maintained.

Some clubs have urged their supervisors to appoint a county board of forestry, who shall have the right to supervise the planting of trees along the public highways. In Los Angeles County such a board has been created, with two of its members women, and already some forty miles of roads have been planted to trees and palms. One district has accomplished legislative work of permanent nature, for the following bill, drafted by one of its members, passed the state legislature and became a law.

"March the seventh of each year, being the anniversary of the birthday of Luther Burbank, is hereby set apart and designated Bird and Arbor Day. All public schools and educational institutions are directed to observe Bird and Arbor Day, not as a holiday, but by suitable exercises having for their object instruction as to the economic value of birds and trees, and the promotion of a spirit of protection towards them."

For more than nine years the people of California, particularly the 500 women of the California Club, worked to interest the Government in protecting the Big Trees from destruction. At last they were successful, for by an act of congress, passed February 18, 1909, a way was found to save for all time one of the most famous groves of trees in the world—the Calaveras Big Grove of California. In the years 1910–11 in addition to all the educational work, study and tree planting being done by the clubs, general forestry work was accomplished both for our own state and the eastern states. Thousands of letters were sent from California to our representatives in congress asking them to vote for the Weeks bill which would establish national forests in the White Mountains and Southern Appalachians for the protection of navigable streams. On the other hand, at our appeal the eastern club women sent thousands of letters to our representatives asking them to revoke the grant of the Hetch Hetchy Valley to San Francisco, while here at home we were not backward in our efforts to save this beautiful valley for the people. We hope and believe our work had some effect, for both of these measures carried. Perhaps nowhere are there more national parks and national monuments than in California, and the Women's Clubs have always listened to all appeals from organizations, and coöperated with them in all measures for the preservation of these National and State playgrounds, not only for to-day but for their great value to the coming generation.

At the Annual Conventions of the California Federations, resolutions have been adopted thus:

At Del Monte, May 1909, against the proposed grant of the water right in the Hetch Hetchy Valley to the city of San Francisco.

At Santa Barbara, May, 1910, in favor of resolution presented by the Women's Clubs of the New England States asking our women to work in favor of the passage of the Weeks bill.

At Paso Robles, May, 1912, for the control of forest fires, and also a resolution in favor of the National Conservation Exposition to be held in Knoxville, Tennessee, in 1913, and the bill before congress to provide for a Government exhibit in the same. At the eleventh biennial General Federation Women's Clubs at San Francisco, June-July, 1912, a protest against any further curtailment of the national conservation fund, and a sufficient appropriation be made to secure our forests against fire.

The club women of the State are also working hard to induce congress to acquire and set apart for a National Park a tract of redwood timber in Humboldt County where the finest redwoods are fast disappearing, and they fear unless quick action is taken these splendid trees will be lost to this and future generations. We feel that what we have done is appreciated. We have received splendid suggestions and practical and valuable assistance from the United States Forest Service, and from the State Board of Forestry, and in return we have done, and will continue to do, all in our power for forestry. State Forester Homans has suggested that the Women's Clubs conduct a publicity campaign against forest fires, and from Washington we are asked "to further the introduction and improvement of courses in forestry in schools in connection with other subjects such as agriculture, nature study and geography." Surely, if we can do real practical work along these lines, we shall feel at the end of the coming year as if we had accomplished much, and had not labored in vain.

As we are so vitally concerned in the future of forestry in the State—knowing that "back of our homes with their ornamentations, lights, heat, and culinary departments lies the forest, back of the very stability of the National Government itself, lies the forest"—we would therefore like to make a few suggestions as to what might be done, not only to protect the forests now standing, but to insure something as well for the coming generation.

We recommend that a sufficient appropriation be made by the State for the acquisition, by purchase, of land for reforestation purposes, for the management and control of same, for the prevention and control of forest fires, for a paid fire fighting force to coöperate with the United States Forest Service; for the purchase of seeds and seedlings for distribution among the farmers of the state in order to encourage tree planting. That the appropriation for printing and binding be sufficient so that the material collected by the State Board of Forestry may be sent to the people, for research work is of little value unless it can be distributed.

Also we believe in a more equitable basis of taxation. Until that end is attained, and the State offers inducements for planting by not urging taxes on timber lands until the timber is ready to cut, we fear there will be very little reforestation by private owners.

We feel sure there is no one woman who has done more for the cause of forestry in California than Mrs. Lovell White, and this article would have little value if there were not some word from her incorporated in it. She sends the following report; we only wish it were longer, but fearing to make it too long she left out the splendid work she has done:

"The biennial meeting of the General Federation of Women's Clubs was held in San Francisco, beginning on June 25th and ending on July 5th. The Conservation Department of General Federation of Women's Clubs includes committees on forestry, waterways, and birds. Other popular features, notably good roads, were presented by the chairman of the department on Thursday, July 1st, when the morning session was given up entirely to the presentation of the subjects above enumerated. The program was unusually fine and a large and enthusiastic audience greeted the speakers from the different states. Both women and men showed a familiarity with their themes, and also a genuine eloquence in dealing with the various phases of the subject.

A conference on forestry attracted a large audience on the afternoon of the same day. The conference was informal, questions were asked, including topics ranging from forest fires to the best manner of disposing of cut brush. The walls of the room were lined with photographic exhibits from Massachusetts, Pennsylvania, and California.

A chairman from every state was appointed to serve on the Conservation Department by the Governing Board of the General Federation of Women's Clubs. The duty of said chairman is to make herself familiar with all the conservation conditions of her state, through the medium of the clubs belonging to the federation of her state.

In this way she can secure information on every point needing exploitation. For the convenience of the state chairman copies of a leaflet containing fifteen questions relating to forestry in general were forwarded to them. These were circulatd throughout the Union. The responses were numerous, showing care and intelligence in the compilation of data. In many instances the state forester had prepared the material.

Many of the states have tree wardens instead of foresters—the duties, however, being similar. The primary principles of forestry are taught in many of the public schools throughout the country. The impression conveyed after reading all the reports sent by the state chairmen is that forestry in the hands of club women is simply of an educational character, confined to lectures before organizations by experts on the subject and to study classes under a leader familiar with the best books written on forestry. The beauty of trees, the poetry and romance of the forest seemed more appealing than questions of practicability.

Few possess state parks planted in native trees. In that respect California shone with splendor—as Redwood Park, consisting of more than 3,800 acres of land, is probably the most extensive and wonderfully wooded state park in America.

The chairman of the forestry committee gave as her part of the morning program on July 1st a description of our parks—including the State Redwood Park—our National Parks, National Forests, and our National Monuments."

In conclusion, we agree with Mrs. White when she says "that women's work in forestry is mainly educational." This work had to be done, however; there is still great need for it, and after all, have we not laid the foundation for the practical work which everywhere is being carried out? We hope and believe the California Federation of Women's Clubs is proving itself an important factor in the cause of forestry. We urge the importance of fire control, and also how necessary it is that what remains of our original forest area, should be administered under the principles of forest science.

FOREST PROTECTION.

By Sarah L. Bowden,

Chairman, Forestry Committee, Out Door Art League of Santa Clara County.

The suppression of forest fires is a matter that every member of the Out Door Art League of Santa Clara County feels of paramount interest and importance; and, either as individuals or as a body, will give any help possible in an educational or legislative campaign for the effective prevention of forest fires.

San José is situated in such close proximity to our beautiful wooded hills and cañons, and to the State Park—only forty miles from the Big Basin—that we feel a special interest in their preservation. Moreover, some of our members are among the most ardent tree lovers in the State; and no more acute pain could come to them than the knowledge of the abuse of camping privileges in our woods.

We are fully aware that under no circumstances is a forest fire of benefit, either from an esthetic or economic point of view. The injury to young timber and yearlings is inestimable, and the burning of dry grass and waste vegetation cannot be a compensation or at all desirable. Timber dealers and lumber companies no longer find it economical to burn over the land from which a sawmill has been fed. Of late years a market has been found for all so-called waste.

The conservation of our forests is now becoming a matter of popular interest. Much is constantly appearing in print regarding it and the educational campaign in that direction grows stronger yearly. We are glad to refute the oft-quoted statement that the Indians found it beneficial to deliberately burn out the undergrowth of the forests at stated seasons. The Indians did have such methods, but they did not conserve their forests; nor was there any need for their doing so, when there was such an abundance of timber and such sparse population. This knowledge is gospel to us of the Out Door Art League. We take every opportunity to disseminate the facts, and to contradict erroneous theories to the contrary.

In the matter of practical work, the Out Door Art League had a representation in Sacramento, and used its influences for the passage of the forestry bill two years ago. Letters were sent by the league to every member of the legislature during its last session, urging the passage of the bill providing for the appointment of a firewarden.

This summer our committee on forestry had an article on the danger of forest fires, with warnings to picnickers and campers, printed in the San José *Mercury;* copies of this were sent to every paper in Santa Clara County, many of which reprinted the article with editorial comment.

In order that forest fires may effectually be prevented there must be a systematic campaign of education inagurated and continued until the importance and necessity of the work shall be made apparent to all. Such work is conservation in its highest and most practical form. It is essentially state work. Hence the Out Door Art League of Santa Clara County favors every well considered measure that will result in the prevention and suppression of forest fires within the State of California and is ready to endorse and support any legislation that will result in protecting and conserving our magnificent forests, the greatest asset of our beautiful California.

NATIVE GROWTH FOR PLANTING IN CALIFORNIA.

By MISS E. PORTER,

Out Door Art League of Santa Clara County.

"My position has been that the woody flora of any particular region is, and must ever be, the one criterion in the determination of our choice of material." (Professor Macbride, University of Iowa.)

The trend of the times is toward the preservation of natural beauty. National, state and city parks make it possible to retain much wild, unspoiled nature, of which we stand in such need. Outside these park areas, it is difficult in the march of civilization, with its manifold industries and occupations, the building of railroads and the making of homes, to preserve natural beauty. But there is the widest desire for it everywhere manifest—among landscape architects, real estate men, public officers, railway officials—and we believe that the more closely nature is studied and her counsels heeded, the less difficult the problem will become.

THE HARMONY OF NATURE.

Nature has covered the architectural foundation—the mountains, cañons and plains—with growing things which are not only in perfect harmony with the structure which they adorn, but with each other. It is possible to destroy the beauty of the landscape, not only by the destruction of this native growth itself, but also by the introduction of foreign growth into its midst, a fact not so widely recognized.

FORESTRY EXPERIMENTS.

In this connection, recent experiments in the Forestry Department are interesting and very encouraging. Where eucalyptus trees have been planted on the lower slopes of the mountains, in southern California, they have not made as satisfactory protection to the watershed as the native chaparral. Even the pines removed from mountain heights to these lower levels do not thrive as well. So it has been decided that in the Forest Reserves, at least for the present, that the manzanita, the buckthorn, the sage, and the wild buckwheat are to remain, clothing the unmarred hillsides with their lovely bloom. It is suggested further, by one writer, that the Government be asked to "reforest" the slopes already denuded, with honey-bearing plants, for the benefit of the beemen. If a useful industry can thus be carried on, at the same time protecting the watershed and preserving characteristic natural beauty, it will be one step toward an ideal civilization.

It is encouraging that the Bureau of Forestry believes it will pay to hold cut-over redwood lands for future crops, which will also aid in preserving the original landscape.

UNNECESSARY PLANTING.

In the making of homes in regions of great natural beauty it would seem desirable to alter the surroundings as little as need be, planting only to restore where nature has been disturbed. But even in summer camps one sees much effort expended in artificial gardening, all out of harmony with the delicate blooms and rugged forest trees. Of course where the home is permanent, and architecture more pretentious, and the need of formal gardening is felt, it is possible to separate the artificial from the natural surroundings, and so prevent incongruity.

It is a pleasure to record here that Mr. F. A. Hihn and Mr. Frank L. Brown in Santa Cruz County, Mrs. Lillian Ferguson in Marin County, Mr. Charles K. Field, and others are helping to restore the characteristic beauty of the redwood region by the planting of these young trees about their homes.

CHARACTERISTIC NATURAL BEAUTY.

Each region has an individual charm produced by its native trees, shrubs and flowers. Even under artificial conditions, by using the native growth for planting, this characteristic beauty is in a great measure preserved. The native elms and maples that shade the streets and highways of New England have their appropriate quiet beauty; the royal palms forming the approach to Cuban haciendas have a tropic splendor in keeping with the landscape; and the moss-draped native oaks that lead to the old plantations of the south have a distinctive beauty that no foreign trees could give.

In Italy eminent men are urging not only the restoration of the classic native growth, but also the "removal of the new and inharmonious." The Italian Government is to restore some of the buildings of ancient Rome and surround them with a magnificent park. Already thousands of young trees have been set out, but only natives of the soil—the laurel and the ilex, the olive and the pine—have been chosen.

Our greatest landscape architects realize the value of characteristic beauty, and the folly of attempting to transform one landscape into another of a totally different kind. Only a few days ago in Denver, William Law Olmsted said (and there is perhaps no higher authority) "we should not try to imitate Eastern landscapes."

The charm of variety is not attained by assembling many kinds of inharmonious trees and shrubs together, but by emphasizing the characteristic growth of each region.

We Californians, a cosmopolitan people, are slowly learning that our architecture and landscape art, as well as mode of dress, must be formed by the natural conditions of the State in which we dwell.

Plants brought from even Arctic regions would in time, no doubt, adapt themselves to new conditions, and grow into harmony with their surroundings, but why should we force nature to repeat her patient processes, when the decoration she has already prepared is so perfect and so beautiful?

TOPOGRAPHY OF CALIFORNIA AND HIGHWAY CONSTRUCTION.

In order to bring the topography of the State clearly before the reader's mind, we quote from the opening chapter of John Muir's "The Mountains of California."

"Go where you may within the bounds of California, mountains are ever in sight, charming and glorifying every landscape. Yet so simple and massive is the topography of the State in general views, that the main central portion displays only one valley, and two chains of mountains which seem almost perfectly regular in trend and height: the Coast Range on the west side and the Sierra Nevada on the east. These two ranges coming together in curves on the north and south inclose a magnificent basin.

"This is the grand central valley of California, the waters of which have only one outlet to the sea through the Golden Gate. But with this general simplicity of features there is great complexity of hidden detail. The Coast Range, rising as a grand green barrier against the ocean, is composed of innumerable forest-crowned spurs, ridges, and rolling hill-waves which inclose a multitude of smaller valleys; some looking out through long, forest-lined vistas to the sea; others, with but few trees, to the central valley; while a thousand others yet smaller are embosomed and concealed in mild, round-browed hills, each with its own climate, soil and productions."

Through this varied and beautiful country the state highway is to pass, and many new county roads are projected or in course of construction. To construct and plant

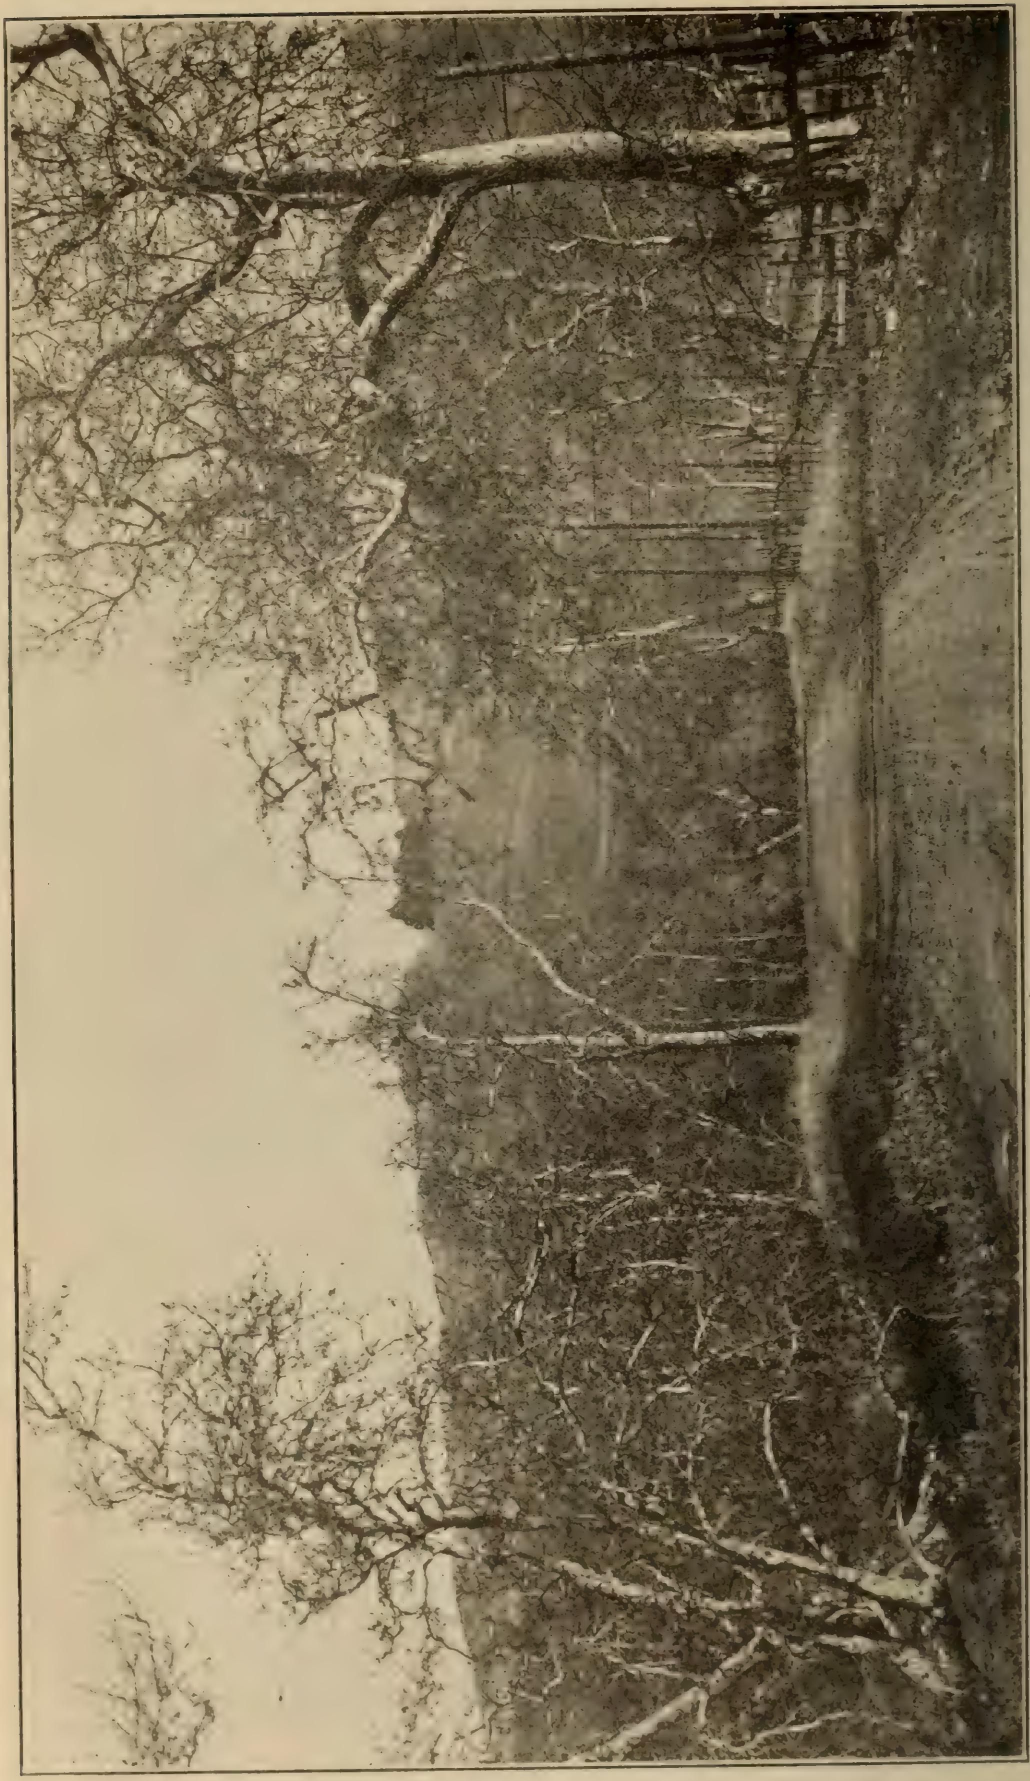


PLATE XI. Native sycamores on Penitencia Creek road, Santa Clara Valley.

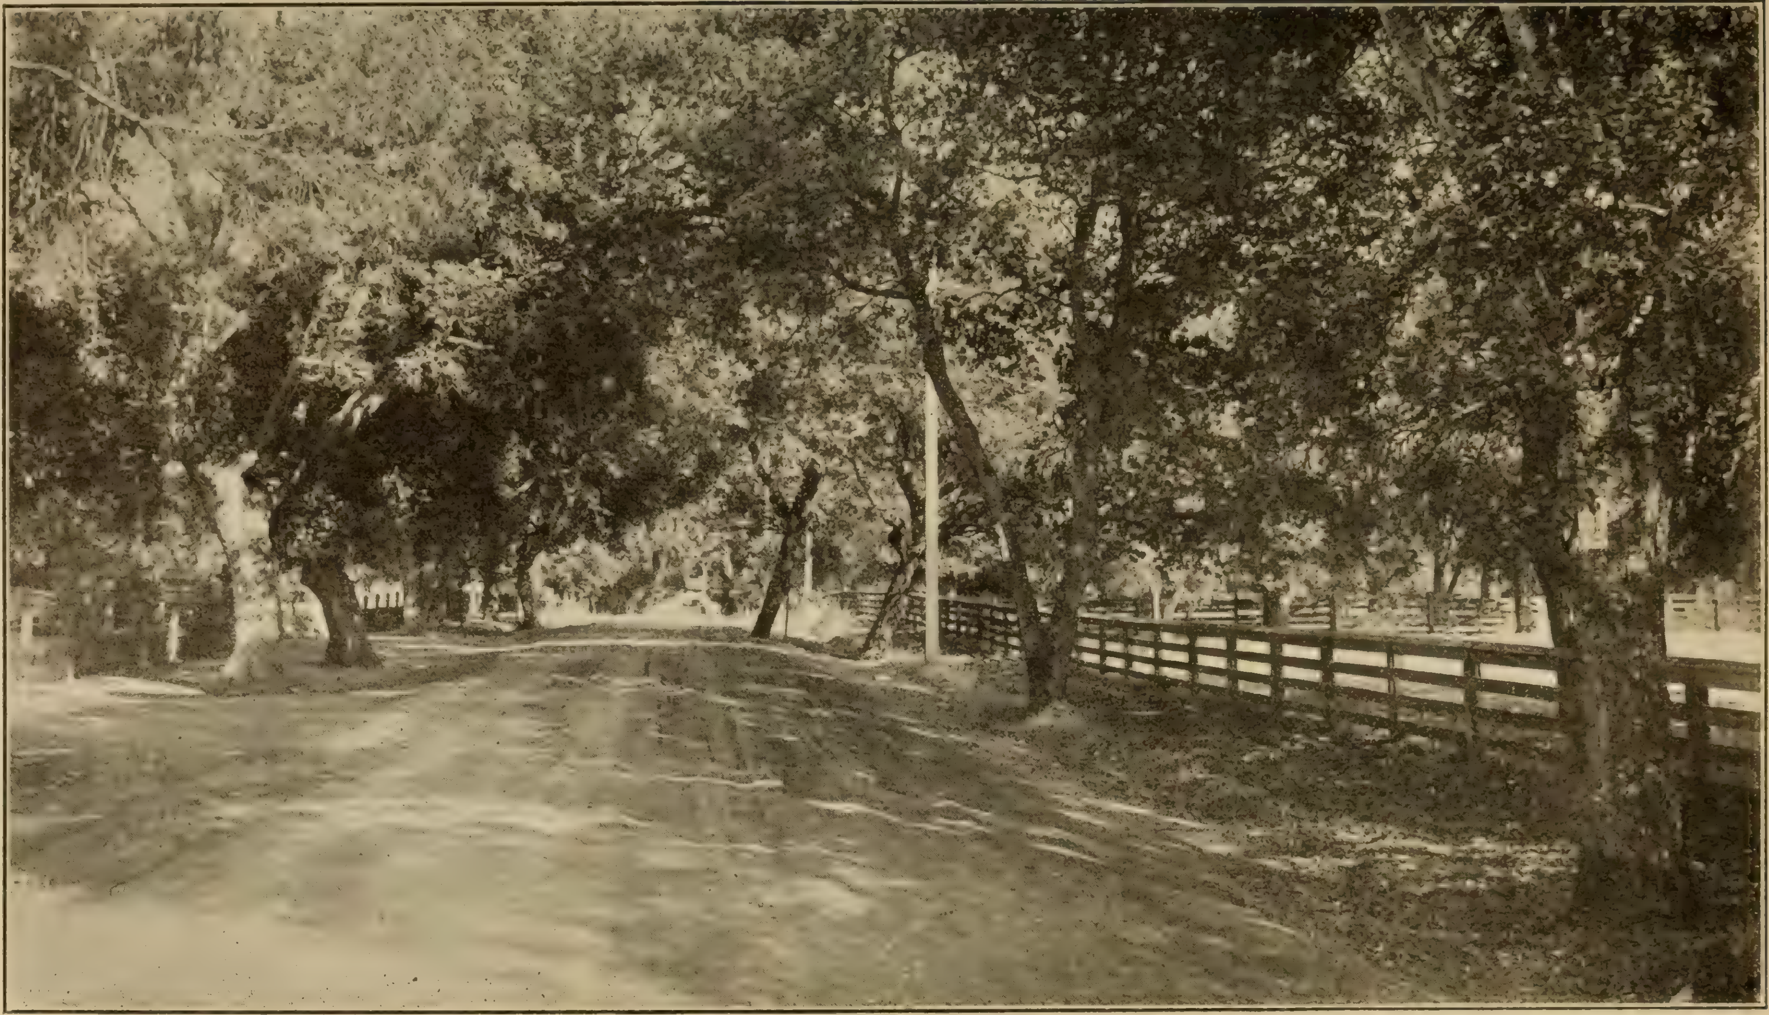

PLATE XII. Native liveoaks on roadway near Palo Alto. Help to further efforts looking toward the preservation of our roadside trees.

these highways, as well as those already made, so that the beauty of the landscape as a whole shall be preserved, is the difficult problem presented.

PLANTING ON MOUNTAIN ROADS.

When the road must penetrate mountain gorges or find its way among the rolling hills, skillful engineering is required to preserve the contour of the land. But in the way of planting only restoration is needed—covering scarred banks with native vines and shrubs which strengthen while they adorn—reforesting with native trees where blackened stumps show that forest giants once stood.

WATERWAYS.

When the highway at lower levels follows where cool alders fringe the stream, or where sycamores define it with their gleaming trunks, where willows bind the banks and make the low-lying country beautiful as the waterway draws near the sea, art and nature counsel "Plant only to restore."

COAST VALLEY ROADS.

When the road winds among the liveoaks of coast valley floors, there seems no question still of introducing foreign growth. What could be more satisfying than such "nature-planted" roadways? And to scatter these trees "whose rounded outlines are repeated in the soft curves of the foothills" along the intervening roadway, linking grove with grove, would seem the logical treatment, if we are to preserve the distinctive charm of the original landscape.

It is true that oaks are comparatively slow growing, but even when no more than shrubs they are very decorative. With proper care the young trees make a surprising growth, and in thirty years a man may stand under a fair sized liveoak of his own planting. But, after all, are we to plant only for ourselves, and give no thought to future generations? It would seem our duty to at least repair the natural loss among our native trees, thus securing the permanent character of the landscape. Besides the esthetic value, there is the historical association and sentiment which are well worth considering.

EXAMPLES OF WRONG PLANTING.

There is no more striking example of unwise planting than parts of the road leading down the San Francisco Peninsula, the old Camino Real which is to be incorporated in the new State highway, where lines of closely planted eucalyptus trees hide and dwarf the low rolling hills beyond. An avenue of eucalyptus trees taken by itself is most impressive and satisfying, with its vista of great trunks and spreading boughs. Taken in connection with the adjoining landscape, and we believe that at least on country roads this is the main point to consider, the effect of the same avenue may be most disastrous.

An avenue of palms stately and beautiful in itself looks out of place in most parts of California. It is making a feeble imitation of the tropics out of a temperate country, often for a purely commercial reason—that is, to please tourists who are even now becoming dissatisfied with this false ideal.

IRREGULAR PLANTING.

Irregular planting of the highway contributes much toward preserving the natural aspect of the country. It helps to prevent the "checkerboard" effect produced by many conventional avenues intersecting each other on a valley floor, when viewed from an adjoining height. Continuous shade is perhaps not so much of a necessity in these days of rapid transit. There are some practical reasons which make a scattered planting very desirable—such as the quicker drying of the road; more easy avoidance of trolley and telephone poles, when the lines must follow the highway, and less injury from shade to some growing crops.

In support of this method of planting we quote from a pamphlet written by G. H. Allen, B. S., and endorsed by the Munson-Whitaker Company, landscape foresters, of New York and Boston. Mr. Allen says, "Along country roads the trees should be planted in an irregular manner, leaving intervals of open. . . . . . Along city streets the trees may be arranged in a more conventional manner, although broken rows are by no means desirable."

A SPECIAL PROBLEM.

The following is one of the problems where the irregular planting of native trees seems the only solution—the planting of a highway which on a valley floor crosses and recrosses a wooded stream, at times following it for a short distance. In such a case, if an attempt is made to plant the highway in a formal manner with exotic trees, the treatment becomes confused and absurd. For either the highway must be broken up into sections by the interruption of the stream, or else the graceful fringe of native trees along the bank is ruined by the regular spacing of foreign trees. By scattering the native oaks, sycamores or willows of the creek bank along the rest of the highway, the harmony of the whole is secured. But, could the highway in the first place have followed the stream, along its entire course, the ideal would have been attained.

NEW RESIDENCE TRACTS.

In laying out residence tracts in wooded regions, curved roads are logical and often employed, even in a level district. The trees are thus more easily avoided, and the beauty of the groves preserved. Little or no planting of the new roads is necessary. Unfortunately examples are to be seen of tracts where straight roads have been driven through the groves of oaks or other native trees, and emphasized by the planting of exotics, all in utter disregard of the original landscape.

CONVENTIONAL AVENUES.

Even when the highway or city street is regularly planted, preference should be given to native trees. The native laurel and big-leaved maple are admirably adapted for conventional avenues. And even the willow or sycamore, though losing in picturesqueness, will with care become more suitable for formal planting.

THE GREAT CENTRAL VALLEY.

In the valleys of the Sacramento and San Joaquin the problem of planting becomes more complex and the ideal more difficult to attain. The treeless stretches of this great valley, with the snow-capped Sierra always in sight as the dominant feature of the landscape, have their own charm. But immediate shade is a necessity in that region of great heat; and there remains only for us to plant in such a way as to mar as little as possible the original beauty of the landscape. Where native trees exist, except in the vicinity of water courses, it is the graceful "weeping oak" that more than any other tree gives distinction to the valley floor. To emphasize this dominant tree, the roble of the Spaniards, more strongly, placing it in groups about homes or irregularly along the highways; and to greatly widen the fringe of native growth with ash, alder and cottonwood along the streams, might be the ideal general treatment for the great valley. For quick shade the oaks could be interspersed with native maples, cottonwoods, and other fast-growing trees. At least let us not thoughtlessly interpose a huge unchanging barrier of alien trees between us and "that wall of light, ineffably fine, and as beautiful as a rainbow, yet firm as adamant."

The gray-foliaged Sabine pine lends a peculiar charm to the hot, dry foothills of the Sierra and other ranges. It should be cherished for its decorative value in the regions where it grows; and the various species of oaks (its associates) depended on for shade.

THE OCEAN SHORE.

Cool breezes make shade less of a necessity in a driveway near the sea. And there is the sense of freedom and wildness and broad outlook over the water to make us hesitate before doing any planting there. It would be a pity to thrust petty designs or tropical foliage on our rugged headlands to disturb the characteristic beauty of the sand dunes; or to make of any roadway following the seashore an aggressive line of planting, destroying the subtle beauty of the shore line and ruining the contour of headland and mountain and gently sloping hill.

When planting seems a necessity there, and it must form an integral part of the landscape, the native growth and its arrangement should be carefully studied. Where shade is needed, groups of native conifers might form the setting for dwellings or other buildings as the road approaches bold promontories. It is significant that when the Monterey pine and cypress are transplanted to our dry inland valleys their life is very much shortened.

Where deep, wooded cañons end abruptly near the ocean, the growth of redwood or other native trees might be extended in straggling groups, as though they had strayed from the main forest. And where willows, laurels and alders follow the water courses quite to the sea, additional irregular plantings of these same trees might be made nearby upon the shore.

THE SEMI-DESERT COUNTRY.

The desert, too, has its unique beauty which needs no adornment from the hand of man. He is, in a sense, an interloper, and should strive, at least, not to "make nature hideous by his presence."

In the semi-desert regions of southern California yuccas and palms may be legitimately used for planting. There is one native species of the latter—*Washingtonia filifera.* If the native trees do not give enough shade, where heat and light are so intense, there are exotics which might properly be made use of, such as the mimosa, the carob, and the locust. These being of the same general type as the native mesquite, they would in a measure preserve the harmony and character of the landscape.

The piñons and junipers which give such a unique charm to the mesas and low hills, should by all means be made use of for home and highway planting in the regions where they grow.

NOT A GEOGRAPHIC LINE.

It will be seen that there is no thought of drawing a mere geographic line in advocating the choice of native trees for planting. By native is meant the tree or shrub indigenous to a given locality, not to the State as a whole. A redwood tree, for instance, transported from a deep, moist cañon of the northern ranges to the level, semi-desert country of southern California, would be out of harmony with its new environment. A foreign tree might be much more suitable from a landscape point of view. There is the beauty of the three or shrub viewed alone, and the beauty that comes from the harmonious whole. The olive is one of the foreign trees that seems not out of place in certain parts of the California landscape.

DETAILS—PRACTICAL WORKING—GENERAL SCHEME.

To sum up: Preserve the original landscape as far as possible by the planting of native growth.

When, for practical reasons, the native trees and shrubs can not be used for planting, select from exotics those which are of the same type—that resemble the native in form, texture or color.

In presenting this paper we feel how incomplete and inadequate it is to this important subject. But we believe that at least the principles set forth are fundamentally correct. Each section of this great State must, with patience and feeling, solve the planting problem for itself.

It is hoped that the bill (initiated by this organization) creating in each county a forestry commission and forester, will, in its amended form, be signed by the Governor at the coming session of the legislature. We believe that it will prove a practical system for the protection and proper planting of highway trees.

But it would seem that the general supervision of some central body is needed to secure the harmonious treatment of the State as a whole, with its varied, wonderful and characteristic beauty.

THE SEQUOIA SEMPERVIRENS OR COAST REDWOOD OF CALIFORNIA.

By Mrs. Stephen A. Jones.

Scientists tell us that in the Pliocene Age there were nearly twenty species of Sequoia of world wide distribution. They grew all over northern Europe, and in North America, from the latitude of Nebraska and Dakota to Greenland and Alaska. Some of these closely resembled our two surviving species. A mild climate and rich soil encouraged the growth of these magnificent forests, and beneath their shade flourished many plants and animals now extinct.

Then came that unexplained change of climate known as the Ice Age, and immense glaciers extended slowly down from the north over this fertile region, planing down hills, filling up valleys, and grinding off the peaks and ridges of mountains. When it passed away, as in the slow eons of time all things pass, many forms of life had perished utterly, and failed to reappear.

Of the Sequoia only two species survived, and these were both in California, the *S. gigantea* being restricted to the western slopes of the Sierra Nevada Mountains, and the *S. sempervirens* to the Coast Range, from the bay of Monterey to the Oregon line.

It is of the latter, the redwood proper, that this paper treats. They are magnificent specimens of the tree world, their fluted columns rising into the air a height of from two to three hundred feet and measuring from thirty to sixty feet in circumference a little above the ground. For a third or more of the height, their trunks are clear of branches; then the boughs covered with the evergreen foliage stretch out and mingle with each other, forming a roof of verdure. The fibrous bark is of a cinnamon brown color, several inches thick. The wood is also of a rich brownish red; in quality light but firm, free and straight grained, quite durable and slow to burn. The tree is tenacious of life, the stumps even of the oldest trunks long retaining their vitality at the circumference and sprouting into a circle of fresh young shoots. It was on this account that the name Sempervirens—ever strong—was given to it. Scientists differ as to age of the largest trees, but the most conservative estimates place it at two thousand years.

When the Anglo-Saxon pioneer first penetrated into the Coast Range Mountains he saw around him vast stretches of forest verdure, a wilderness ocean. Along the crests, down the ridges, on all the slopes and in the cañons stood the shaggy growth of centuries.

Redwoods rose in stately ranks, and around them, reaching to their lower branches, grew other coniferous trees, also oaks, madrones, horse chestnut, button-wood and laurel. Lower still were thickets of hazelnut, berry bushes and vines, manzanita, California lilac, wild roses, azalea and honeysuckle. Of ferns there was a great variety, the *Woodwardia* having fronds from eight to ten feet long.

From innumerable springs little rills trickled down to join the streams and swell the creeks, in whose waters could be found an abundance of fish. The forest abounded in game—bear, deer and smaller animals. Into this region settlers came and secured land, taking up timber claims and acquiring a title from the Government. The great commercial value of these forests was apparent, and as soon as wagon roads could be cut, sawmills were erected at convenient places on the water courses. The trees that clothed the ridges near what is now Redwood City were the first to fall, being the most accessible, and the lumber was hauled by teams to build the houses of San Francisco. Year after year new roads were cut, new mills put up, and the destruction of the redwoods went on.

A half century has witnessed the gradual denuding of these mountains, until now only a few sections remain whose original beauty has been untouched by ax or fire. The traveler who passes along the roads sees only here and there a remnant of the primeval forest; but he sees everywhere immense stumps, and often prone columns, stately even in their stripped and scorched condition. In some places a thicket of young growth has sprung up, presenting a surface of green foliage to the eye, but in many sections the traveler sees only a parched and barren expanse, stumps, burned logs, the dry beds of streams and a general aspect of desolation.

The building of railroad lines into the rich forests has facilitated the destruction of trees. The branch of the Southern Pacific Railroad which reaches the town of Boulder Creek in the Santa Cruz Mountains, is said to be the most profitable, according to its length, of any part of that system. Its cars haul away from this region annually millions of feet of lumber in various forms—boards, shingles, stakes, railroad ties, telegraph poles, and cordwood. A thousand men find employment in the vicinity of Boulder Creek, and the bare and dusty hillsides bear mute witness to their industry in the past. As a result, this region, one of the most beautiful formerly, is now one of the most barren and unattractive. Springs have dried up, water courses have shrunk to mere threads or disappeared entirely, and the winter rains, no longer held in check by the porous soil of the forests, rush away in torrents as soon as they cease to fall. Even the climate has changed. The rainfall at Boulder Creek was formerly the heaviest in the State, reaching the large amount of 100 inches annually; it is now 40 inches.

Having thus hastily sketched the history and destruction of the redwoods, I will relate the fortunate preservation of the last surviving remnant of these forest monarchs.

THE RESCUE OF THE REDWOODS.

In the northern part of Santa Cruz County, surrounded by ridges of the Coast Range, lies a vast natural amphitheater, known as the Big Basin. It is a heavily wooded tract of land, varied by hills and valleys and traversed by clear streams, which take their rise from the many springs within its boundaries. These streams, uniting to form creeks, find their way through deep, rugged gorges, and finally empty into the Pacific Ocean, not many miles away. From the seaward or western buttress—a ridge 2,300 feet high—one obtains a magnificent view of the ocean on one side and the unbroken forest of the Big Basin on the other.

The land slopes away steeply on either side of this ridge, and the beholder sees, by only turning his head, the foam-fringed shore of the blue Pacific, ten or fifteen miles away, and the tranquil, dark green depths of the redwoods. On the seaward side he can view some traces of the presence and handiwork of man; a lighthouse here and there on a projecting point, a cleared space in the forest, the roof of a ranch home far away. But on the landward side it is just as nature left it, a solid surface of tree tops down all the slopes and in all the cañons.

The Big Basin is not many miles from Boulder Creek, the center of the lumbering industry of this section, but its natural ramparts have preserved it from violation. It would be slow and costly work to cut wagon roads into it and undertake to mill the standing timber and haul it out by teams; so while waiting for the railroad to tunnel through one of its ridges and build a branch line into it, the millmen contented themselves with denuding the more accessible hillsides in the neighborhood of Boulder Creek. But redwood lumber was rising in value in proportion as it grew scarce, and at last the word went forth that the Big Basin was to be invaded, and the last remnant of virgin forest was to be given over to destruction.

Then the dormant public sentiment was aroused; then the cry sent up, "Save the redwoods!" Letters began to appear in the newspapers; scientists bewailed the impending loss to the world; utilitarians prophesied the drying up of all the streams which had their rise in the Big Basin, and the consequent loss of the water for practical uses; sentimentalists deplored the despoiling of so much beauty; sportsmen remembered the deer covers and the trout pools.

Finally, in May, 1900, a party of eight, consisting of representatives of these various classes, went to the place with a view of exploring it, learning the facts of the case, and seeing what measures, if any, could be taken to rescue the redwoods from total destruction.

When our purpose was announced, every facility was placed at our disposal and every courtesy shown us by the owners of the land. We went to Boulder Creek by rail, and thence by team twelve miles into the Big Basin. We took our own tents and bedding, but provisions were hospitably supplied us, likewise the services of a cook and guide. At the end of the wagon road the team left us, and we pitched our tents on the banks of a clear stream, fringed with elders and azaleas, and shaded by giant redwoods.

From this camp, as headquarters, we made long excursions on foot into the depths of the primeval forest. Without a guide we could not have found our way, for the trails were dim and overgrown, often marked only by obscure blazes on trees. Even old hunters, and others experienced in woodcraft, have been lost in this Basin, for it is one succession of wooded hills and valleys and running streams after another, all so much alike that the traveler gets bewildered.

Indian file, with the guide leading, we made our way through the untrodden forest, crossing streams on boulders or fallen logs, beating our way through thickets of hazelnut and huckleberry bushes, coming out into beautiful park-like openings clear of underbrush, hearing no sounds but the querulous challenge of a bluejay or the chatter of a squirrel. It was truly:

"Primeval forest, virgin sod
That Saxon hath not ravished yet."

All around us the redwoods rose in stately ranks, their evergreen boughs blending far above our heads, so that we seemed to be walking through the aisles of some vast natural cathedral.

As we penetrated into the remote recesses of the forest, wondering what new scene of beauty would be unfolded before us as we climbed a ridge or turned the flank of a hill, we realized the joy of explorers; we understood how, in all ages, the charms of the wilderness have lured men away from civilization, and made them count as mere trifles the attendant hardships.

Some of our party measured trees and estimated their commercial value, with a view to naming a price for the land in the event of a future purchase; the sportsmen fished in the trout streams; the poet heard music in the sighing of the wind amid the lofty tree tops; while our photographer set up his camera and took many views of the forest scenery. This gentleman, Andrew P. Hill of San José, has been identified from the first, heart and soul, with the movement to save the redwoods, and though many enthusiastic workers have lent their aid by tongue and pen, by personal influence and active effort, to the cause, yet when a list of all who have participated is written, his name, like Abou Ben Adam, will lead all the rest.

We wandered in this magnificent forest for several days, meeting no one, hearing no human voice except that of our own party and apparently as remote from civilization as if hundreds of miles intervened between us and the haunts and homes of men. The only signs we saw to prove that we were not the first to tread the wilderness were two deserted cabins, on different sections and far apart, which had been the abode of the original owners of this land when they lived on it in order to take up their claims. These cabins stood open to wind and weather and blackberry vines grew on the hearthstones and over the ballen sticks of the mud-daubed chimneys. Nature was fast reclaiming her own. Ferns, waist high, grew around the doorways and obliterated the paths leading to spring or stream, and only the shy lizard darted across the floor which had once echoed to human footsteps.

One night, sitting around our camp fire, with the murmer of the stream in our ears, and the stars visible through the interlacing redwood boughs above us, we talked of the best way to begin in the matter of trying to preserve this forest, to preserve it not only for ourselves and our friends, but for the State, for the world for future ages.

We then and there formed the Sempervirens Club, and pledged ourselves to work for the purchase of this forest as a state park.* It was deemed unwise to ask the General Government to buy it for a reservation, as there was already a bill before congress asking for an appropriation for the purchase of the Big Tree Grove in Calaveras County, so we decided to solicit State aid in the matter.

We came out of the Big Basin full of enthusiasm for our project, and for the next few months we talked of little else. The movement met with warm approval from some people, with outright opposition from others, while many regarded it with apathetic indifference.

Newspapers rallied to our standard, university professors and teachers generally were in sympathy; so were such organizations as the Pioneers' Society, the Native Sons and Native Daughters, etc. We had gained an option of the land most heavily wooded, and the owners promised that no sawmills should be erected or cutting done until the legislature, to meet the following winter, had been asked for an appropriation. In the months that intervened a campaign of education was carried on. Circulars setting forth the project and illustrated by cuts reproduced from photographs taken by Mr. Hill in the Basin were scattered broadcast over the State; innumerable newspaper articles were written; public meetings were held; civic bodies and fraternal organizations passed resolutions. On the other hand, the movement was scoffed at as the project of dreamers and enthusiasts; hard-headed business men said it would not succeed; politicians called it a scheme to rob the State for the benefit of the owners of the Big Basin.

People meeting us on the street stopped to say in the soothing tone one would use to a mentally unbalanced fanatic: This idea of yours is a fine one, but it is impractical; the State will never appropriate so much money for an obscure tract of land away off in the Santa Cruz Mountains. But as Tennyson says in his poem, "The Defense of Lucknow," after stating with cumulative force all the hardships and horrors of that siege—

> "Ever upon the highest roof, the banner of England blew."

So in the face of a thousand difficulties and discouragements the friends of this movement pressed on; so, figuratively speaking, above the din and conflict waved the banner of the Sempervirens Club. Finally, the legislature met, the bill was introduced; then came the tug of war. Friends lobbied for it, enemies opposed it, politicians wrangled over it; leading newspapers of the State took sides for and against it. Space forbids the giving of particulars. Suffice it to say that the fight was a hard one. But finally it became apparent that public sentiment was in favor of it. The bill passed the house and was brought into the senate, had a narrow escape from being snowed under, was rescued and read out of its turn, and passed in the closing days of the session. The next question was, would the Governor sign it or give it a pocket veto? Strong pressure was brought to bear on him to prevent his signing it. These were anxious days for the friends of the movement. They made their first rally, and the consequence was that a flight of telegrams from all over the State reached the Governor's office and lay on his desk and floor as "thick as autumn leaves in the vale of Vallombrosa."

He was convinced that the people wanted, with genuine and strong desire, to save for themselves and posterity that heritage of the ages, that forest of redwoods. He signed the bill, and a shout of triumph went up from all who had worked for the cause. In accordance with the provisions of the bill he named a board of five commissioners, of which he was a member by virtue of his office, to negotiate the purchase of the desired tract. Some delay ensued, as surveys had to be made, boundaries determined upon, titles looked up and other tedious details settled, but a tract of thirty-eight hundred (3800) acres, including the most heavily wooded land in the Big Basin, has now been formally acquired by the State, and is called the State Redwood Park.

---

* May 18, 1900.

The original Sempervirens Club, instead of dissolving, as a body whose work is finished, has just been reorganized, with a larger membership than ever. In the future it will work for the acquisition of adjoining territory, for the enlarging and beautifying of the tract thus rescued from destruction.

As a recent result of its efforts, and through the influence of our representatives at Washington, several tracts of adjacent land belonging to the National Government, amounting in all to three thousand one hundred and sixty (3,160) acres, have been given to the park.

That the public appreciates this playground and breathing space provided for them in the midst of inspiring surroundings, is attested by the fact that many hundreds visit it every summer. For their convenience a more direct route of access is desirable, and it is hoped that a new and shorter road into it from Santa Clara Valley may soon be opened.

Also, a scenic boulevard, within the boundaries of the Park, which would permit travel by carriage and automobile, where now there are only narrow foot-trails.

The late Father Kenna, formerly of Santa Clara College, who was identified with the movement to save the Big Basin redwoods and who served on the Commission in an official capacity, was especially active in the matter of building highways to render the Park more accessible. He exerted his influence by tongue and pen, to this end, and one of the last acts of his noble, unselfish life was to collect money to pay for a survey for a scenic driveway around and through the Park. When this project is finally realized, and a name for the new road is chosen, what more appropriate and fitting than to call it the Kenna boulevard?

In conclusion, the writer of this article would like to say that as a charter member of the Sempervirens Club, and one who rejoices in its achievements, she does not wish to claim all the glory of victory for the club. To be sure, we were on the fighting line and our battle cry, "Save the Redwoods," sounded above the din of conflict; but we also heard the shouts of unseen allies, and felt behind us the support of a statewide public sentiment.

It was the reënforcement from invisible spiritual sources, the encouragement and support from scores and hundreds outside the actual membership of the club, which finally enabled our little band of fighters to win the victory. To them much of the credit of the result is due; certainly without their assistance it never could have been achieved.

CHAPTER IX.

SUGGESTIONS TO THE PROSPECTIVE FOREST STUDENT.

In response to the many inquiries received by the department, relative to the opportunities presented by Forestry, and the kind of preparation necessary to fit oneself for this profession, the following information has been prepared. And questions which are not covered here will always be promptly and willingly answered by this department.

Forestry is still a new, and yet clearly established profession, and it presents almost unlimited possibilities to the technically trained man. But there is no profession in existence which demands a more thorough preparation. The first demands for foresters were met with an inadequate supply and it was possible for all to secure employment. Although the profession cannot yet be called crowded, it has reached that stage where the employer, whether it be the Government, State, or private owner, demands high credentials and thorough training of the applicant.

Many young men are attracted to the profession of forestry because of the glamour of the outdoor life, and the rather wide travel which often goes with the work. Being a new profession it is often painted in romantic colors, and no mention is made of the hardships and privations, which must be endured by every forester. Some of these men will be quickly weeded out, but there are many who derive great pleasure and opportunity for development from such work.

The prospective forester may best begin his preparation by a full course in some college where he can gain a knowledge of the basic subjects of forestry. He should include in this course the studies of geology, botany, chemistry, mineralogy, and mathematics, including a practical understanding of the principles of surveying. Graduation at such a college should be followed by a course at some school of instruction in professional forestry.

As far as possible, the vacations should be spent in the woods, acquiring a practical knowledge of forest methods. It is essential that every forester should have a thorough knowledge of lumbering methods, for lumbering is more closely allied to forestry than any other profession. The student may elect to get his practical training by working for the Government service, the State service, or for a private lumber concern.

The only position in the Government service, open to those whose training in forestry is incomplete, is that of field assistant. This is merely a temporary position and was created solely for the purpose of familiarizing young men who are thinking of following forestry in the field and office methods of the Government service. The work is severe and monotonous and no one should accept a position as field assistant unless he is bodily sound and willing to work. The work consists mostly in "valuation surveys" or the measurement of the standing timber on given acres and in "stem analysis" or measurements of the contents and rate of growth upon felled trees. The pay is $50 per month and living expenses, but the student is required to pay his own traveling expenses from his home to the field.

Several of the states employ temporary help during the field season. The work varies considerably in the different states. Where there is a state forest reserve the work is greatly similar to that of the Government, but in the states where there is no state revenue, the work consists mainly of technical investigations throughout the state, under the direction of the forester. The pay differs, depending upon the state and the kind of work, but it is generally about the same as that of the field assistant in the Government Forest Service.

The best way to gain a practical knowledge of lumbering methods is by working for a private lumber concern, and the prospective forester who can spend at least one vacation in working in a logging camp or sawmill, will be able to gain a much broader knowledge of the practical application of forestry. Forestry is largely a matter of the economic use of forests—in other words, of forest operations, and to thoroughly understand utilization, life in close touch with lumbering operations is a necessity. The combination of practical woodcraft and theoretical forestry should be the aim of all students of the subject.

Where the prospective forester is unable to follow up some course similar to the one prescribed, it becomes a question as to what may best be omitted. If one cannot spend the time necessary to complete both the college course and the graduate course at a professional school, the best method is to select some good under-graduate school of forestry. There are several colleges in this country where a very good training in forestry is given. In fact, it is still open to question whether many of these colleges do not offer as satisfactory a course of training as the graduate schools. It is essential, however, that as much time as possible be spent in the woods gaining practical experience in forest methods.

It must be remembered, that in forestry, as in any other scientific profession, only the man who has had a thorough and systematic training can hope to succeed. Other conditions being equal, it is the man with the best training who is always selected for advancement.

No profession offers greater opportunities for individual success through public service than does forestry. Private forestry presents a comparatively new field, for it is only of recent years that the private and corporate owners have paid any attention to the problem of the preservation of their forests and future cuttings. But it is likely, that as forestry becomes recognized, and its practice financially justifiable, private work will offer a more attractive field and greater opportunities than public. Whatever the field, success in the work can only be won by conscientious effort, and involves not only a thorough technical training, but also a practical insight into actual forest conditions.

For those who do not desire to practice forestry or lumbering, there are many opportunities for investments in timber lands which will yield a good revenue, and to one who has not the capital necessary to become an investor, the opportunities offered in the timber brokerage business are unexcelled.

As regards compensation, forestry offers a fair living to the trained man. The trained forester, upon entering the Government service, is given the position of forest assistant. This position carries a salary of $1,100 to $1,200 a year in the beginning, with the payment of all living and traveling expenses incident to field work. The highest salary paid in the Government service is $5,000 a year, which is the salary of the forester. In State work, the salaries vary with the states, but the average is no higher than that received in Government work. It is impossible to estimate the salaries paid in private practice for each concern has its own standard.

Forest Schools in the United States.

The general interest in forestry has grown with marked rapidity in the last two decades. The Federal Government has created National Forests, and several states have established reserves or parks. Many private owners realize the practicability of employing foresters to care for their properties, and an improvement in the smaller holdings is already noticeable.

The early education of the people at large and of their governments on the subject of forestry, was carried on by the United States Division of Forestry and especially by forestry associations which were organized in all parts of country.

Some provision for technical education was made long before opportunity for its application had arisen, and before any professional foresters were in existence to do the teaching. Educational institutions were attracted by the new doctrine, and the desire to assist in the popular movement, led to the introduction of forestry, at least by name, into their curricula. Professors in botany and horticulture, in addition to their regular work would explain as far as they knew, the methods of forestry, or at least give lectures on dendrology and forest geography. By 1897, twenty land grant colleges had in this way introduced the subject.

Dr. Bernhard E. Fernow, LL.D., organized the first professional forest school when, in 1898, he founded the New York State College of Forestry at Cornell University. Dr. Schenck almost simultaneously opened a private school at Biltmore, North Carolina, and thus the era of forest schools was inaugurated.

A year later, Mr. Pinchot endowed another forest school at Yale University. This was followed, in 1902, by the University of Michigan adding a department of forestry, and then followed a real realm of educational enthusiasm, one institution after another adding the subject to its courses.

Today, forestry is taught in three technical or special schools in the United States and elementary courses on the subject are given in several colleges and preparatory schools. A point has been reached where it deserves attention and a desire has been expressed to introduce this nationally important and interesting study in the public schools.

Dr. Schenck states that the tendency in the United States as well as in Germany, with reference to the forest schools, is a tendency of decentralization. This is unfortunate, as small schools do not develop specialists and to further the policy of forestry, specialists are required.

There are now more than twenty different colleges and universities giving complete graduate or under-graduate courses leading to professional degrees in forestry, and several others giving some instruction in the general principles of forestry or in certain branches of it. The principles of forestry are also taught in an elementary way in numerous secondary schools, and one state has a school to fit rangers for its own forest work. This indicates a great advance in forest education and an urgent demand for it. Therefore, a young man wishing to enter forestry work, can find ample opportunity for preparation.

Following is a list of institutions giving instruction in forestry in the United States:*

Post-Graduate.

1. Yale University, Forest School, New Haven, Connecticut.
2. University of Michigan, Forest School, Ann Arbor, Michigan.
3. Harvard University, Forest School, Cambridge, Massachusetts.

The forest schools at Yale and Michigan give a two-year post-graduate course and the degree of Master of Forestry. In addition, Yale has a two months' summer course at Milford, Pike County, Pennsylvania; and Michigan, a six weeks' summer school at Roscommon.

Harvard has a two-year graduate course.

Under-graduate.

The following schools give a four-year course leading to a degree in Forestry:

1. Colorado School of Forestry, Colorado Springs, Colorado. (Also a summer course.)
2. Harvard University, Forest School, Cambridge, Massachusetts. (In Lawrence Scientific School.)
3. Cornell University, Ithaca, New York. (New York State College of Agriculture.)
4. University of Washington, School of Forestry, Seattle, Washington. (Also three months' winter course for forest rangers.)

The following give a three years' course:

1. Berkshire Forest School, Mount Washington, Massachusetts.
2. Pennsylvania State Forest Academy, Mont Alto, Pennsylvania. (Practical work in summer months on Mont Alto Reservation.)

The following schools give short terms or special courses in forestry. Such as devoting certain periods in some term of an agricultural course, giving lectures, two months' summer course in forestry, farm forestry, etc.:

1. Idyllwild School of Forestry, Riverside County, California.
2. Stanford University, Palo Alto, California.
3. University of Chicago, Chicago, Illinois.
4. Winona College of Agriculture, Winona Lake, Indiana.
5. Berea College, Berea, Kentucky.
6. Eric Forest School, Duxbury, Massachusetts.
7. Mount Hermon Boys' School, Mount Hermon, Massachusetts.
8. Smith's Agricultural School and Northampton School of Technology. Northampton, Massachusetts.
9. Crookston School of Agriculture, Crookston, Massachusetts.
10. University of Montana, Missoula, Mont. (Courses in botany and forestry leading to a degree, and short courses in forestry in January, February and March.)
11. Hobart College, Geneva, New York.
12. University of Syracuse, Syracuse, New York. (Technical forestry in junior and senior years. Professional forestry degree after one year spent in graduate study and field work.)
13. Biltmore Forest School, Biltmore, North Carolina. (Course covers one full year leading to degree of Bachelor of Forestry, and, with two years of practical work, the degree of Forest Engineer. It is now a traveling school, having working fields during twelve months of each year.)
14. State Forest School, Bottineau, North Dakota.
15. Antioch College, Yellow Springs, Ohio.
16. Murray State School of Agriculture, Tishomingo, Oklahoma.

---

*"American Forestry," September, 1911, issue.

17. Middlebury College, Middlebury, Vermont. (Two years' course in forestry.)
18. Marathon County School of Agriculture and Domestic Economy, Wausau, Wisconsin.
19. Wyman's School of the Woods, Munising, Michigan. (Two years practical course.)

Land grant colleges.

Those giving a four years' course leading to a degree in forestry, are:

1. State Agricultural College, Fort Collins, Colorado.
2. Georgia State College of Agriculture, University of Georgia, Athens, Georgia.
3. University of Idaho, Moscow, Idaho.
4. Iowa State College of Agriculture and Mechanical Arts, Ames, Iowa. (Horticulture and Forestry.)
5. Kansas State Agricultural College, Manhattan, Kansas. (Also post-graduate work.)
6. University of Maine, Orono, Maine. (Also post-graduate work in forestry, leading to a degree of M.S. and a correspondence course in forestry.)
7. Michigan State Agricultural College, East Lansing, Michigan. (Also a five-year course open to graduates of the eighth grade. Graduate work with M.S. degree.)
8. College of Forestry, University of Minnesota, St. Paul, Minnesota. (Offer a four weeks' winter course, including forestry, also graduate work.)
9. Montana Agricultural College, Bozeman, Montana. (Forestry also included in the three-year horticultural course.)
10. University of Nebraska, College of Agriculture, Lincoln, Nebraska. (Instruction in forestry is also included in the one year teachers' course in agriculture for high and normal school teachers.)
11. College of Agriculture and Domestic Science of the Ohio State University, Columbus, Ohio. (Forestry also offered in the first term of the second year of the two-year course in horticulture.)
12. Oregon State Agricultural College, Corvallis, Oregon. (Two-year elementary course in forestry and a six weeks' winter course for forest rangers.)
13. Pennsylvania State College, State College, Pennsylvania. (Forestry, also an elective in the two years' agricultural course.)

Those institutions who devote merely a "period" or year to forestry in connection with their other courses, etc., are:

1. Alabama Polytechnic Institute, Auburn, Alabama.
2. Agricultural and Mechanical College for Negroes, Normal, Alabama.
3. University of Arkansas, Fayetteville, Arkansas.
4. University of California, Berkeley, California. (Course of ten lectures by members of the Forest Service during the summer session.)
5. Connecticut Agricultural College, Storrs, Connecticut.
6. Delaware College, Newark, Delaware.
7. University of Illinois, Illinois.
8. Purdue University, Lafayette, Indiana.
9. Maryland Agricultural College, College Park, Maryland. (Besides the weekly lectures in forestry, farm forestry is taught in the two-year agricultural course.)
10. Massachusetts Agricultural College, Amherst, Massachusetts. (Lectures given annually by State Forester.)
11. Mississippi Agricultural and Mechanical College, Agricultural College, Mississippi.
12. College of Agriculture, University of Missouri, Columbia, Missouri.
13. University of Nevada, Reno, Nevada. (Forestry taught as an elective in the four years' agricultural course.)
14. New Hampshire College of Agriculture and Mechanical Arts, Durham, New Hampshire. (Junior and senior years of agricultural course and in both years of the two years' course.)
15. North Carolina Agricultural and Mechanical College, West Raleigh, North Carolina. (Senior elective, first term, agricultural course.)
16. State Agricultural and Mechanical College for the Colored Race, Greensboro, North Carolina.
17. North Dakota Agricultural College, Agricultural College, North Dakota. (Six weeks' course in forestry in the junior year of agricultural course.)
18. Oklahoma Agricultural and Mechanical College, Stillwater, Oklahoma.
19. Rhode Island College of Agriculture and Mechanical Arts, Kingston, Rhode Island.

20. Clemson Agricultural College of South Carolina, Clemson College, South Carolina.

21. South Dakota Agricultural College, Brookings, South Dakota.

22. University of Tennessee, Knoxville, Tennessee.

23. Agricultural and Mechanical College of Texas, College Station, Texas.

24. Agricultural College of Utah, Logan, Utah. (The U. S. Forest Service and the Utah College offer jointly a three months' winter course for forest rangers.)

25. Virginia Agricultural and Mechanical College and Polytechnic Institute, Blacksburg, Virginia.

26. Hampton Normal and Agricultural Institute, Hampton, Virginia.

27. State College of Washington, Pullman, Washington. (Besides teaching a semester in the horticultural course, there is a school of forestry with a two-year course.)

28. West Virginia University, Morgantown, West Virginia.

29. University of Wisconsin, Madison, Wisconsin.

CHAPTER X.

APPROPRIATIONS AND EXPENDITURES.

The sixty-third and sixty-fourth fiscal years date from July 1, 1911, to July 1, 1913. The appropriations for the above mentioned fiscal years were as follows:

Salary of State Forester	$6,000 00
Salary of Deputy State Forester	3,600 00
Salary of Assistant State Forester	3,200 00
For support of State Board of Forestry, including field and traveling expenses	15,000 00
For printing, binding, stationery, etc.	2,500 00
Total	$30,300 00

The expenditures under this appropriation were as follows:

Salary of State Forester (to November 1, 1912)	$4,000 00
Salary of Deputy State Forester [1](to November 1, 1912)	2,045 00
Salary of Assistant State Forester [2](to November 1, 1912)	1,867 03
Total	$7,912 03
Balance November 1, 1912	$4,887 97

Appropriation for support of State Board of Forestry		$15,000 00
Equipment, supplies and miscellaneous	$870 39	
Fire investigations	845 67	
Educational work (attendance at forestry meetings, lectures delivered, etc.)	974 47	
Forest studies:		
Taxation of timber lands	1,019 10	
Ownership of timber lands	2,038 21	
Cut-over lands	1,691 86	
Street and highway planting	375 77	
Postage	418 00	
Telephone, telegraph and expressage	225 53	
Stenography, typewriting and clerical help	1,911 45	
Janitor	225 00	
Total		10,595 45
Balance November 1, 1912		$4,404 55
Appropriations for printing, binding stationery, etc.		$2,500 00
Fire warnings and notices	$227 37	
Stationery	272 21	
Binding	7 78	
Fire reports, bulletins, forms, etc.	1,247 49	
Total		1,754 85
Balance November 1, 1912		$745 15

The unexpected balance is extremely limited in view of the amount of work in hand. The field investigations could not be conducted as extensively as it was our desire to do, but a good showing has been made nevertheless for the amount expended and the balance of $4,404.55 is in itself so limited that but little new work can be undertaken until the next appropriation.

The foregoing summary explains why the very limited appropriation of $17,500 is entirely disproportionate to the value of the work to the State. The present lack of adequate funds is a problem that burdens the State Forester continually. It is a most undesirable handicap since the progress of the department is hindered in consequence.

---

[1] [2] A temporary vacancy existed in the office of both the Deputy and Assistant State Forester during the sixty-third fiscal year.

We have tried to show, by the following estimate, just what is needed for the sixty-fifth and sixty-sixth fiscal years. In order to successfully carry on the work the law contemplates this department shall do, it will be necessary to provide adequate funds. The estimates have been carefully prepared and are designed to show just what is needed.

The present forest laws contemplate that the Department of Forestry shall prevent and suppress forest fires; ascertain the amount and value of forest resources; collect and publish data looking toward a more economic and rational use of forest products; and coöperate with municipalities and individuals in matters pertaining to forest fires, planting and management. The appropriation made, however, is inadequate to carry on much of the work.

The importance of putting into operation a far-sighted forestry policy cannot be over-estimated. It should be borne in mind that the amount asked for in this estimate is an initial rather than an increased appropriation. An appropriation to actually carry on the work of the Forestry Department has never been made.

It is essential that experienced men, who are also trained foresters, be employed. Such men cannot be secured for the salaries now being paid, or if secured, remain only a short length of time. As a result, changes are constantly being made. I urgently recommend an increase of salary, especially for the deputy and assistant, as follows: State Forester, from $3,000 to $3,600 per annum; Deputy State Forester, from $1,800 to $2,400 per annum; Assistant State Forester, from $1,600 to $1,800 per annum.

A biennial appropriation of $15,000 has been made to carry on the work of the department. This includes all field and traveling expenses and general support of the board. It is the entire working capital. The expenses for traveling, temporary assistants, clerical help, equipment, expenses for running the office, books, photographs, fire investigations, and many miscellaneous expenditures, must all be paid from it.

That needed investigations may be undertaken, and the expenses for an entomologist and two forest inspectors may be met, an increase of $10,000 is recommended.

The present appropriation for printing and binding is $2,500. This limited amount must cover the cost of stationery, binding, fire warning notices, fire report and prosecution forms, burning permits, forest laws and publications. Bulletins, circulars, and published results of investigations cost money. The present allotment is insufficient for stationery and fire material alone; and because the work of this department is educational as well as administrative, an increase of $5,000 is earnestly recommended.

No appropriation has been made for the prevention and suppression of forest fires. There are 381.4 billion feet, board measure, of timber in the State of California, of which 248.1 billion feet is privately owned. It has a stumpage value of no less than $762,000,000, and the privately owned timber has a stumpage value exceeding $496,000,000. For every 1,000 feet, board measure, of timber burned the community looses $10 in wages. Reproduction on cut-over land must be protected from fire; and money, expended for fire protection, is nothing more than insurance. There are approximately 10,000,000 acres of timber and brush covered land not protected by the government. State control being essential, the State should be divided into thirty districts with a paid fire patrolman in charge of each. They should receive a salary of $75 per month and expenses, which will amount to about $100 per month for each man. Tools, equipment, transportation, subsistence and pay for temporary fire fighters will require an additional amount of $80,000. Since a perpetual supply of timber is an absolute requisite for the prosperity of the State, a total biennial appropriation of $132,500 (or two-third cent per acre per annum) is necessary to protect the forest wealth of California. This is a conservative estimate and is based on a fire season of five months.

Two forest inspectors at $1,500 per annum (total $6,000) will be needed to assist in establishing fire districts, outlining patrol routes, locating sites for lookout stations, supervision of telephone construction, preparing district maps, assisting in prosecutions, making fire investigations and studying effects of fire; reporting on dangerous slashing and railroad rights of way; inspecting donkey engines, traction engines, sawmill smoke stacks and locomotive smoke stacks. Their work will also call them among timber owners for the purpose of organizing protective associations; with stockmen and summer resort proprietors for purposes of forming similar associations and with county officials for the purpose of county coöperation. The work will be conducted with this end in view; that the cost to the State will, eventually, be greatly reduced.

Problems, peculiar to forestry, which are as important to the forester in comparison as the problems which confront the physician, chemist or astronomer and which can only be solved in a laboratory (the importance of which no one questions), must be solved by systematic experiments and for this an experimental station is necessary. It is important to know what species are best adapted for different purposes, in localities having a wide variance in soil, moisture and climatic conditions. How long a time will be required for trees to reach marketable dimensions; fertility of the seed, and many other practical problems can be solved only at a properly conducted experimental station.

About one hundred and sixty (160) acres of cut-over land should be secured, that practical methods of reforestation can be worked out. Land, suitable for such a purpose could be secured for $1,500. Construction of buildings, lath house, etc., will cost $3,000, and maintenance and up-keep $3,000, annually. An experimental station director at $1,200 per annum will be needed. Seedlings could then be supplied at cost, upon application, to facilitate the reforestation of watersheds and cut-over lands.

An unestimated amount of timber is destroyed annually by forest insects. That the amount of damage to standing and felled timber may be accurately determined and practical methods of control devised, it is urged that this work be added to and undertaken by this department. It cannot be satisfactorily handled by any other branch of the State service. There is an unlimited field for original investigations without duplication of work. The forest crop deserves attention as well as agricultural crops. An entomologist at $1,600 per annum is recommended.

Summary of Estimates.

Appropriation made in 1911.	Amount.	Increase recommended.	Total recommendation for 1913.
Salary of State Forester	$6,000	$1,200	$7,200
Salary of Deputy State Forester	3,600	1,200	4,800
Salary of Assistant State Forester	3,200	400	3,600
Support State Board of Forestry	15,000	10,000	25,000
Printing and binding	2,500	5,000	7,500
Totals	$30,300	$17,800	$48,100 30,300
Total increase			$17,800

New Appropriation Recommended.

Designation.		Amount.
Prevention and suppression of forest fires		$132,500
30 district firewardens, 5 months at $75 per month	$22,500	
Traveling expenses of wardens at $100 per month	30,000	
Equipment and fire fighting	80,000	
	$132,500	
Forest experimental station		4,500
Purchase of site, 160 acres	$1,500	
Construction	3,000	
	$4,500	
Salary experimental station director		2,400
Support of experimental station		6,000
Salary 2 forest inspectors at $1,500 per annum		6,000
Salary forest entomologist		3,200
Total		$154,600

NOTE.—The complete report could not be published because of the lack of funds. The portions omitted pertain to forest fire, ownership of timber lands, forest taxation, forest laws, and studies completed since the last report.

The completed studies are available for distribution in bulletin form. They are "Wood-using Industries of California," and "Pharmacal Plants and Their Culture."

FORTY-FOURTH ANNUAL REPORT

OF THE

INSURANCE COMMISSIONER

STATE OF CALIFORNIA

FOR THE YEAR ENDING DECEMBER 31, 1911

E. C. COOPER, Insurance Commissioner
SAN FRANCISCO

SACRAMENTO
Friend Wm. Richardson - - Superintendent of State Printing
1912

FORTY-FOURTH ANNUAL REPORT

OF THE

INSURANCE COMMISSIONER OF THE STATE OF CALIFORNIA.

INSURANCE DEPARTMENT,
SAN FRANCISCO, July 1, 1912.

To His Excellency HIRAM W. JOHNSON,
Governor of the State of California.

SIR: In compliance with the provisions of section 595 of the Political Code, I herewith respectfully submit the Forty-fourth Annual Report of this Department, pertaining to all classes of insurance business and covering the calendar year ending December 31, 1911.

The total number of insurance companies, except fraternal insurance societies, authorized to transact business in the State of California during 1911 was 258, classified as follows:

California stock fire and marine insurance companies	3
California county mutual fire insurance companies	18
California legal reserve life insurance companies	7
California assessment life, accident and health insurance companies	1
California miscellaneous stock companies	11
Other states stock fire and marine insurance companies	87
Other states mutual fire insurance companies	4
Other states fire inter-insurance associations	2
Other states legal reserve life insurance companies	34
Other states assessment life insurance companies	2
Other states miscellaneous stock companies	47
Foreign stock fire and marine insurance companies	39
Foreign miscellaneous stock companies	3
	258

The above shows an increase of 25 in the number of authorized companies on December 31, 1911, as compared with last year's report.

In addition to the above, twenty-four brokers were licensed under section 596 of the Political Code to write "Surplus Line" insurance. Nine confined their business to fire insurance, eight transacted both fire and marine and miscellaneous business, and six transacted no business.

COMPANIES ORGANIZED IN CALIFORNIA DURING 1911.

California National Life Insurance Company, San Diego, incorporated as a legal reserve stock company	February 15, 1911.
California State Life Insurance Company, Sacramento, incorporated as a legal reserve stock company	December 27, 1911.
Sunset Assurance Association, San Diego, incorporated as a mutual life, health and accident company on the assessment plan in accordance with section 453*d* to 453*p* (both inclusive) of the Civil Code	September 6, 1911.
Premier Indemnity Assurance Company, San Diego, incorporated as a stock, accident and health insurance company	October 16, 1911.

The above companies were examined as required by section 597 of the Political Code, were found to have complied with all the requirements of the law, and were licensed to commence business in California on the dates mentioned above.

COMPANIES ADMITTED DURING THE YEAR.

The following named companies were admitted to transact business in the State during the year:

Fire and Marine (Stock).

American Union Fire Insurance Company	Philadelphia, Penn.
Detroit Fire and Marine Insurance Company	Detroit, Mich.
Franklin Fire Insurance Company	Washington, D. C.
National Ben Franklin Fire Insurance Company	Pittsburg, Penn.
New Jersey Fire Insurance Company	Newark, N. J.
Northern Insurance Company	New York, N. Y.
Standard Fire Insurance Company	Hartford, Conn.
Sovereign Fire Assurance Company	Toronto, Canada.
United Firemen's Insurance Company	Philadelphia, Penn.

Fire and Marine (Mutual).

Central Manufacturers Mutual Insurance Company	Van Wert, Ohio.
Fitchburg Mutual Fire Insurance Company	Fitchburg, Mass.
Indiana Lumbermen's Mutual Insurance Company	Indianapolis, Ind.
Northwestern Mutual Fire Association	Seattle, Wash.

Life (Legal Reserve).

California National Life Insurance Company	San Diego, Cal.
California State Life Insurance Company	Sacramento, Cal.
International Life Insurance Company	St. Louis, Mo.

Life (Assessment).

Guarantee Fund Life Association	Omaha, Neb.
Merchants' Life Association	Burlington, Iowa
Sunset Assurance Association	Santa Barbara, Cal.

Miscellaneous (Stock).

American Casualty Company	Tacoma, Wash.
American Fidelity Company	Montpelier, Vt.
Equitable Surety Company	St. Louis, Mo.
German Commercial Accident Company	Philadelphia, Penn.
Great Eastern Casualty Company	New York, N. Y.
Inter-Ocean Life and Casualty Company	Indianapolis, Ind.
Medical Protective Company	Fort Wayne, Ind.
Premier Indemnity Assurance Company	San Diego, Cal.
Royal Indemnity Company	New York, N. Y.

County Mutual Fire Insurance Company.

Butte County Farmers' Mutual Fire Insurance Company	Chico, Cal.

Inter-Insurance Associations.

Individual Underwriters of New York	New York, N. Y.
New York Reciprocal Underwriters	New York, N. Y.

COMPANIES WITHDRAWN.

The following named companies ceased transacting business during the year, under the following conditions:

Ætna Indemnity Company, of Hartford, went into the hands of a receiver on January 11, 1911.

Colorado National Life Insurance Company, of Denver, was reinsured by the Columbian National Life Insurance Company, of Boston, on June 9, 1911.

Eastern Fire Insurance Company, of Atlantic City, was reinsured by the Camden Fire Insurance Company of Camden, April 18, 1911.

Golden State Life Insurance Company, of Los Angeles, merged with the San Francisco Life Insurance Company, on October 1, 1911.

Rochester German Fire Insurance Company, of New York, merged with the German-American Insurance Company of New York, on May 1, 1911.

Spring Garden Insurance Company, of Philadelphia, Union Insurance Company, of Philadelphia and the Insurance Company of Pennsylvania, merged on August 16, 1911, under name of ''Insurance Company of the State of Pennsylvania.''

The Union Health and Accident Insurance Company, of Denver, notified this Department on February 15, 1911, that it had no outstanding risks in California and had withdrawn from the State.

The United Surety Company, of Philadelphia, went into the hands of a receiver on January 13, 1911.

The Washington Fire Insurance Company was reinsured by the Fireman's Fund Insurance Company of San Francisco.

COMPANIES EXAMINED.

The following named companies were examined as to their financial condition by this Department during the year:

California Companies.

California National Life Insurance Company, San Diego.
California State Life Insurance Company, Sacramento.
Golden State Life Insurance Company, Los Angeles.
Los Angeles Fire Insurance Company, Los Angeles.
Occidental Life Insurance Company, Los Angeles.
Pacific Coast Casualty Company, San Francisco.
Pacific Mutual Indemnity Company, Los Angeles.
Pacific Mutual Life Insurance Company, Los Angeles.
Pacific Surety Company, San Francisco.
Premier Indemnity Assurance Company, San Diego.
San Francisco Life Insurance Company, San Francisco.
Sunset Assurance Association, Santa Barbara.
West Coast Life Insurance Company, San Francisco.
Western States Life Insurance Company, San Francisco.

Companies of Foreign Countries.

Law Union and Rock Insurance Company (Pacific Coast Department), London.

DEPOSITS MADE BY COMPANIES IN CALIFORNIA.

The following tabulations show deposits of securities on December 31, 1911, made through this Department, with the State Treasurer of California:

For the benefit of all Policyholders.

Name of company.	Location.	Deposited in accordance with	Amount of deposit.
*California Mutual Benefit Society	San Francisco	Section 453e, Civil Code	$5,000 00
Fireman's Fund	San Francisco	Section 618, Political Code	100,000 00
*Fidelity Mutual Aid Association	San Francisco	Section 453e, Civil Code	5,000 00
Pacific Coast Casualty Company	San Francisco	Section 618, Political Code	282,500 00
Pacific Mutual Indemnity	Los Angeles	Section 618, Political Code	115,000 00
Pacific Mutual Life	Los Angeles	Section 618, Political Code	250,000 00
Pacific Surety Company	San Francisco	Section 618, Political Code	104,250 00
Sunset Assurance	Santa Barbara	Section 453e, Civil Code	5,000 00
*Mutual Indemnity	San Francisco	Section 453e, Civil Code	5,000 00
Total			$871,750 00

*Companies not now licensed.

For the benefit of all Policyholders in the United States.

Name of company.	Location.	Deposit as per	Amount of deposit.
New Zealand Insurance Company	Auckland	Section 594a, Political Code	$250,000 00
Western Assurance Company	Toronto	Section 594a, Political Code	101,200 00
Total			$351,200 00

For the benefit of Registered Policyholders.

Name of company.	Location.	Deposit as per	Amount of deposit.
Occidental Life	Los Angeles	Section 634, Political Code	$100,000 00
Pacific Mutual Life	Los Angeles	Section 634, Political Code	1,653,125 00
San Francisco Life	San Francisco	Section 634, Political Code	55,800 00
Western States Life	San Francisco	Section 634, Political Code	101,000 00
Total			$1,909,925 00
Aggregate			$3,132,875 00

SUMMARY OF ASSETS, LIABILITIES, AND SURPLUS.

The following summary shows the total capital stock, total admitted assets, total liabilities, total net surplus and surplus as regards policyholders of California companies, companies of other states, companies of foreign countries, and the totals thereof, taken from the reports filed by the companies:

	California companies.	Companies of other states.	Companies of foreign countries.	Totals.
Capital stock (paid up in cash)	$9,051,000 00	$102,032,354 00	$12,561,900 00	$123,645,254 00
Total admitted assets	44,749,673 06	4,261,844,110 25	111,585,916 91	4,418,179,700 22
Total liabilities (except capital)	29,340,061 19	3,798,840,190 71	69,618,970 98	3,897,799,222 88
Net surplus	6,358,611 87	360,063,809 09	29,405,045 93	395,827,466 89
Surplus as regards policyholders	15,409,611 87	462,096,163 09	41,966,945 93	519,472,720 89

Divided as follows:

California Companies.

	Fire and marine.	Life.	Miscellaneous.	Totals.
Capital stock (paid up in cash)	$2,109,000 00	$3,600,000 00	$3,342,000 00	$9,051,000 00
Total admitted assets	10,274,867 87	27,887,357 81	6,587,447 38	44,749,673 06
Total liabilities (except capital)	5,291,893 83	22,583,465 08	1,464,702 28	29,340,061 19
Net surplus	2,873,974 04	1,703,892 73	1,780,745 10	6,358,611 87
Surplus as regards policyholders	4,982,974 04	5,303,892 73	5,122,745 10	15,409,611 87

Companies of other states.

	Fire and marine.	Life.	Miscellaneous.	Totals.
Capital stock (paid up in cash)	$62,481,904 00	$13,445,350 00	$26,105,100 00	$102,032,354 00
Total admitted assets	391,854,703 13	3,774,872,611 97	95,116,795 15	4,261,844,110 25
Total liabilities (except capital)	200,566,728 15	3,553,045,576 04	45,227,886 52	3,798,840,190 71
Net surplus	128,806,070 98	207,473,929 48	23,783,808 63	360,063,809 09
Surplus as regards policyholders	191,287,974 98	220,919,279 48	49,888,908 63	462,096,163 09

Companies of foreign countries.

	Fire and marine.	Miscellaneous.	Totals.
Deposit capital	$11,561,900 00	$1,000,000 00	$12,561,900 00
Total admitted assets	100,749,118 56	10,836,798 35	111,585,916 91
Total liabilities (except capital)	61,659,469 35	7,959,501 63	69,618,970 98
Net surplus	27,527,749 21	1,877,296 72	29,405,045 93
Surplus as regards policyholders in United States	39,089,649 21	2,877,296 72	41,966,945 93

PREMIUM INCREASE AND DECREASE.

The fire insurance business reported by authorized companies shows an increase in premiums received of $254,378.90; while the reports filed by brokers licensed to place business in unauthorized companies show a decrease of $55,439.22.

The marine business (including team and vehicle) reported by authorized companies shows an increase of $141,182.61, and reports filed by the brokers licensed to place business in unauthorized companies show an increase of $10,595.48.

The ordinary life insurance business shows an increase in premiums received on new policies of $396,114.34, and renewal premiums of $914,049.52.

The industrial life insurance business shows an increase in premiums received on new policies of $2,901.88, and an increase in premiums received on renewals of $178,287.84.

Returns made by the assessment life insurance companies show an increase in premiums received of $21,903.74.

The returns made by the county mutual fire insurance companies show an increase in premiums received of $18,118.05.

The health, accident, liability, fidelity and surety, plate glass, boiler and machinery, burglary and theft, title, workmen's collective, team and vehicle, automobile property damage, fly wheel, credit indemnity, physicians' defense, and sprinkler insurance, all show an increase in premiums received, while live stock shows a decrease.

Premiums Received and Losses Paid.

	Premiums received.	Losses paid.
Fire (Stock)	$16,074,851 27	$4,593,654 61
Fire (Mutual)	34,938 83	10,564 58
Fire (Inter-Insurance)	45,112 91	----------
Fire (County Mutual)	66,103 20	31,854 69
Marine (including Team and Vehicle)	2,321,318 35	1,375,225 59
Life (Ordinary)	14,811,167 84	5,719,644 03
Life (Industrial)	1,466,605 96	354,320 28
Life (Assessment)	274,780 77	222,294 31
Accident	1,268,899 34	528,944 12
Health	209,304 31	93,473 92
Liability	1,268,386 67	390,930 32
Fidelity and Surety	795,967 03	173,388 58
Plate Glass	158,278 94	42,141 36
Boiler and Machinery	52,931 58	1,206 50
Burglary and Theft	103,030 69	49,937 08
Title	839,750 16	2,125 93
Workmen's Collective	63,715 26	25,387 24
Team and Vehicle (including automobile property damage)	62,136 41	21,888 74
Fly Wheel	1,370 78	----------
Sprinkler	10,946 96	958 86
Credit Indemnity	33,805 00	6,739 81
Live Stock	15,068 57	10,930 00
Physicians' Defense	3,390 74	124 55
Totals	$39,981,861 57	$13,655,735 10

In addition to the above, the "Surplus Line Brokers" reported as follows:

	Net premiums received.	Losses paid.
Fire	$57,096 17	*
Marine	62,591 10	*

FIRE INSURANCE.

The total number of companies authorized to transact fire business during the year was 114.

Of these, 108 were stock companies, 4 were mutual companies, and 2 were inter-insurance associations.

The amount written during 1911 was $368,563,729.03 less than written in 1910.

The premiums received show an increase of $254,378.90, while the losses paid show a decrease of $1,409,207.19.

The comparisons are shown by the following figures:

Amount written in 1911	$966,664,270 00
Amount written in 1910	1,335,227,999 03
Decrease	$368,563,729 03

---

*Losses not reported.

Premiums received in 1911	$16,154,903 01
Premiums received in 1910	15,900,524 11
Increase	$254,378 90
Losses paid in 1911	$4,604,219 19
Losses paid in 1910	6,013,426 48
Decrease	$1,409,207 29

Fifteen new companies and associations were licensed to transact fire insurance business during the year, namely:

American Union Fire Insurance Company	Philadelphia
Central Manufacturers Mutual Fire Insurance Company	Van Wert
Detroit Fire and Marine Insurance Company	Detroit
Fitchburg Mutual Fire Insurance Company	Fitchburg
Franklin Fire Insurance Company	Washington, D. C.
Indiana Lumberman's Mutual Insurance Company	Indianapolis
Individual Underwriters of New York	New York
National Ben Franklin Fire Insurance Company	Pittsburg
New Jersey Fire Insurance Company	Newark
New York Reciprocal Underwriters	New York
Northern Insurance Company	New York
Northwestern Mutual Fire Association	Seattle
Standard Fire Insurance Company	Hartford
Sovereign Fire Assurance Company	Toronto
United Firemen's Insurance Company	Philadelphia

The following summary shows the amount of risks written, premiums received, losses paid and ratio of losses to premiums, comparing business done by California companies, companies of other states, companies of foreign countries, and the totals thereof:

	California companies.	Companies of other states.	Companies of foreign countries.	Totals.
Amount written	$35,051,042 00	$614,231,878 00	$317,381,350 00	$966,664,270 00
Premiums received	867,818 64	10,160,270 53	5,126,813 84	16,154,903 01
Losses paid	259,944 19	2,904,969 86	1,439,305 14	4,604,219 19
Ratio of losses to premiums	29.9	28.5	28.0	28.5

The foregoing figures show that 3.6 per cent of the fire business was written by California companies, with a loss ratio of 29.9 per cent; 63.6 per cent by companies of other states, with a loss ratio of 28.5 per cent, and 32.8 per cent by companies of foreign countries, with a loss ratio of 28.0 per cent.

The following tabulation shows that during the past twenty-seven years the fire insurance companies have received in premiums in California $231,265,439.49, and paid out in losses $236,221,011.79:

	Premiums received.	Losses paid.	Ratio of losses to premiums.
1884	$4,538,062 44	$1,295,594 48	28.5
1885	4,540,883 39	2,033,257 05	44.8
1886	5,185,772 23	2,654,371 08	51.2
1887	5,590,353 89	2,101,482 52	37.6
1888	6,087,041 48	3,049,030 42	50.1
1889	6,158,754 64	2,572,001 93	41.7
1890	6,303,324 05	2,753,392 22	43.7
1891	6,669,998 72	2,408,156 05	36.1
1892	6,975,185 15	2,715,819 95	38.9

	Premiums received.	Losses paid.	Ratio of losses to premiums.
1893	$6,780,453 93	$2,667,160 24	39.4
1894	6,336,734 55	2,815,671 30	44.4
1895	4,704,584 11	2,850,672 07	60.6
1896	3,817,316 18	2,645,397 45	69.3
1897	4,767,019 28	2,637,706 71	55.3
1898	6,657,887 55	3,578,294 69	53.7

"SURPLUS LINE" FIRE INSURANCE.

The returns made by brokers licensed to place business in companies not authorized to transact business in this State under the provisions of section 596 of the Political Code show a decrease in amount procured or placed during the year, premiums charged therefor, amount canceled and premiums returned, as shown by the following comparisons:

Gross amount procured or placed during 1911	$4,945,872 16
Gross amount procured or placed during 1910	10,840,080 12
Decrease	$5,894,207 96
Premiums charged in 1911	$70,290 88
Premiums charged in 1910	141,017 78
Decrease	$70,726 90
Amount canceled during 1911	$1,941,565 00
Amount canceled during 1910	4,052,380 05
Decrease	$2,110,815 04
Premiums returned in 1911	$13,194 71
Premiums returned in 1910	28,482 39
Decrease	$15,287 68

---

*Includes some payments for losses suffered in 1906.

The decrease in "Surplus Line" fire insurance transacted during 1911, as compared with that of 1910, is due largely to San Francisco's return to more normal conditions and the duly admitted companies being able to better carry the risks. During 1911 only seventeen brokers transacted "Surplus Line" fire insurance in California as against twenty in 1910.

COUNTY FIRE MUTUALS.

The business transacted by the companies referred to as "County Fire Mutuals" shows an increase in amount written, premiums received and losses paid, as shown by the following figures:

Amount written in 1911	$8,785,679 88
Amount written in 1910	7,191,689 25
Increase	$1,593,990 63
Premiums received in 1911	$66,103 20
Premiums received in 1910	47,985 15
Increase	$18,118 05
Losses paid in 1911	$31,854 69
Losses paid in 1910	25,389 29
Increase	$6,465 40

MARINE INSURANCE.

The returns made by the companies authorized to transact this character of business show an increase in the amount written in 1911 over that written in 1910 of $38,260,938.70 and an increase in the amount of premiums received of $141,182.61, with a decrease in losses paid of $313,840.22. The comparisons are as follows:

Amount written in 1911	$412,159,573 00
Amount written in 1910	373,898,634 30
Increase	$38,260,938 70
Premiums received in 1911	$2,321,318 35
Premiums received in 1910	2,180,135 74
Increase	$141,182 61
Losses paid in 1911	$1,375,225 59
Losses paid in 1910	1,689,065 81
Decrease	$313,840 22

The business of marine insurance for the year 1911 is indicated in the following summary, in which is given the amount of risks written, premiums received and losses paid, and ratio of losses to premiums of

California companies, companies of other states, and foreign countries and the totals thereof:

	California companies.	Companies of other states.	Companies of foreign countries.	Totals.
Amount written	$82,474,412 00	$70,899,408 60	$258,785,752 40	$412,159,573 00
Premiums received	479,534 03	757,729 16	1,084,055 16	2,321,318 35
Losses paid	255,283 63	439,650 80	680,291 16	1,375,225 59
Ratio of losses to premiums	53.2	58.0	62.7	59.2

These figures show that 20.0 per cent of the marine business was written by California companies, with a loss ratio of 53.2 per cent; 17.2 per cent by companies of other states, with a loss ratio of 58.0 per cent, and 62.8 per cent by companies of foreign countries with a loss ratio of 62.7.

The following tabulation shows that during the past twenty-seven years the marine companies have received in premiums $45,797,876.12, and paid out in losses $27,948,414.76:

	Premiums received.	Losses paid.	Ratio of losses to premiums.
1884	$1,433,138 20	$468,410 86	32.7
1885	1,395,993 67	855,630 41	61.3
1886	1,515,279 79	676,325 30	43.8
1887	971,859 86	583,772 27	60.1
1888	1,752,696 58	955,239 49	54.5
1889	1,602,434 12	926,811 88	57.8
1890	1,526,453 95	1,109,431 64	72.7
1891	1,927,088 44	736,735 18	38.2
1892	1,638,876 63	1,059,120 83	64.6
1893	1,354,439 16	808,792 67	59.7
1894	1,113,840 90	418,106 22	37.5
1895	1,249,317 11	887,761 60	71.1
1896	1,418,739 79	819,221 66	57.7
1897	1,689,658 74	1,375,911 66	81.4
1898	1,789,140 56	765,624 90	42.8
1899	1,557,487 19	818,261 22	52.5
1900	1,938,123 83	1,134,047 78	58.5
1901	1,802,525 31	978,308 20	54.3
1902	1,692,599 26	1,074,070 22	63.5
1903	1,511,365 30	1,034,522 92	68.4
1904	1,502,518 52	899,004 65	59.8
1905	1,581,196 83	1,463,939 42	92.5
1906	1,628,982 01	1,394,987 73	85.6
1907	1,885,535 22	1,276,704 91	67.7
1908	1,864,861 07	994,487 39	53.3
1909	1,952,269 99	1,368,892 35	70.1
1910	2,180,135 74	1,689,065 81	77.4
1911	2,321,318 35	1,375,225 59	59.2
Totals	$45,797,876 12	$27,948,414 76	

"SURPLUS LINE" MARINE INSURANCE.

The returns made on marine surplus line insurance show an increase in amount placed and premiums charged therefor, and an increase in amount canceled with a decrease in premiums returned.

The figures are as follows:

Gross amount procured or placed during 1911	$4,235,617 30
Gross amount procured or placed during 1910	3,725,167 27
Increase	$510,450 03

Premiums charged in 1911	$64,773 95
Premiums charged in 1910	55,705 62
Increase	$9,068 33

Amount canceled during 1911	$179,362 00
Amount canceled during 1910	160,715 00
Increase	$18,647 00

Premiums returned during 1911	$2,182 85
Premiums returned during 1910	3,710 00
Decrease	$1,527 15

LIFE INSURANCE.

Level Premium Companies.

The total number of companies transacting this character of insurance business in the State of California during 1911 was 41. Of these seven were organized under the laws of California and thirty-four under the laws of other states.

The amount written in 1911 was $62,960,670.00, represented by 27,298 policies, while the amount written in 1910 was $54,270,117.85, represented by 24,334 policies, showing an increase in amount written during the year of $8,690,552.15, represented by 2,964 policies.

The premiums received on new policies in 1911 amounted to	$2,237,336 59
The premiums received on new policies in 1910 amounted to	1,841,222 25
Showing an increase of	$396,114 34

The amount renewed in 1911 was $323,163,978.00, represented by 149,059 policies, while the amount renewed in 1910 was $273,419,799.96, represented by 127,699 policies, showing an increase in amount renewed of $49,744,178.04, represented by 21,360 policies.

The renewal premiums in 1911 amounted to	$12,573,831 25
The renewal premiums in 1910 amounted to	11,659,781 73
Showing an increase of	$914,049 52

The total premiums received in 1911 were	$14,811,167 84
The total premiums received in 1910 were	13,501,003 98
Showing an increase of	$1,310,163 86

The amount in force at close of 1911 was	$402,642,991 00
The amount in force at close of 1910 was	365,459,289 65
Showing an increase of	$37,183,701 35

The number of policies in force at close of 1911	185,171
The number of policies in force at close of 1910	169,907
Showing an increase of	15,264

The losses and endowments paid in 1911 amounted to	$5,719,644 03
The losses and endowments paid in 1910 amounted to	4,771,862 70
Showing an increase of	$947,781 33

Three new life insurance companies were licensed to transact business in California during the year, namely:

California State Life Insurance Company, Sacramento, Cal.
California National Life Insurance Company, San Diego, Cal.
International Life Insurance Company, St. Louis, Mo.

INDUSTRIAL BUSINESS.

Three companies transacted this character of business during the year, and the comparisons are shown by the following figures:

	Number.	Amount.
Policies written during 1911	89,844	$13,816,386 00
Policies written during 1910	90,569	14,307,792 00
Showing a decrease of	725	$491,406 00
Policies renewed during 1911	202,347	$25,493,433 00
Policies renewed during 1910	180,233	31,979,211 00
Showing an increase of	22,114	$3,514,222 00
Total premiums received during 1911		$1,466,605 96
Total premiums received during 1910		1,285,416 24
Showing an increase of		$181,189 72
Total losses paid during 1911		$354,320 28
Total losses paid during 1910		305,356 64
Showing an increase of		$48,963 64

The amount in force at close of 1911 was $46,092,104.00, represented by 284,062 policies, while the amount in force at close of 1910 was $40,040,942.00, represented by 241,742 policies, showing an increase of $6,051,162.00, represented by 42,320 policies.

The following summary shows the condition of life insurance business in California for the year 1911:

Ordinary Life Business.

Number of policies in force	185,171
Amount of insurance in force	$402,642,991 11
Premiums received	14,811,167 84
Losses and endowments paid	5,719,644 03

Industrial Life Business.

Number of policies in force	284,062
Amount of insurance in force	$46,092,104 00
Premiums received	1,466,605 96
Losses and endowments paid	354,320 28

The following figures show that the premiums received during the past twenty-seven years by the ordinary life insurance companies in California have been $177,803,879.15, and the losses and endowments paid $73,313,257.89:

	Premiums received.	Losses and endowments paid.
1884	$1,548,671 16	$1,426,340 26
1885	1,590,344 82	1,114,844 57
1886	1,802,916 68	1,116,729 44
1887	2,073,203 65	1,051,055 11
1888	2,839,141 80	1,205,106 91
1889	3,253,759 62	1,545,497 51
1890	3,507,207 07	1,485,143 27
1891	3,818,753 65	1,626,832 60
1892	4,096,824 84	1,594,898 56
1893	4,255,153 76	2,093,825 96
1894	4,086,307 40	1,943,243 18
1895	4,077,486 45	1,973,822 49
1896	4,004,510 06	2,106,786 19
1897	4,252,455 64	2,068,975 06
1898	4,491,699 78	2,471,974 78
1899	4,925,429 09	2,473,543 38
1900	5,683,412 06	2,430,650 33
1901	6,242,443 41	2,975,847 61
1902	7,480,488 89	2,887,479 63
1903	8,866,405 31	2,881,932 78
1904	10,166,656 76	3,121,817 19
1905	10,550,503 86	3,400,490 37
1906	10,643,952 00	4,081,162 73
1907	11,017,207 20	4,995,417 25
1908	11,658,903 26	4,343,935 04
1909	12,557,869 31	4,404,398 96
1910	13,501,003 98	4,771,862 70
1911	14,811,167 84	5,719,644 03
Totals	$177,803,879 15	$73,313,257 89

The returns made by the companies transacting industrial business for the ten years ending December 31, 1911, are indicated by the following summary:

	Premiums received.	Losses paid.
1902	$794,019 00	$117,748 30
1903	507,075 00	148,061 00
1904	667,152 51	169,933 98
1905	725,705 69	175,854 95
1906	810,355 30	213,436 29
1907	845,188 77	212,701 78
1908	920,464 73	225,829 95
1909	1,058,790 00	275,574 95
1910	1,285,416 24	305,356 64
1911	1,466,604 96	354,320 28
Totals	$9,080,772 20	$2,198,818 12

ASSESSMENT LIFE INSURANCE.

Four companies were authorized to transact this character of insurance business during the year and reported as follows:

	Number.	Amount.
Certificates in force December 31, 1910	10,732	$21,464,000 00
Certificates issued during year 1911	2,623	4,389,400 00
Totals	13,355	$25,853,400 00
Certificates terminated during year 1911	785	1,556,700 00
Certificates in force December 31, 1911	12,570	$24,296,700 00
Premiums or assessments received		274,780 77
Losses paid		222,294 31

MISCELLANEOUS INSURANCE.

All the classes of miscellaneous business show a gain over the preceding year except live stock, as shown by the following figures:

HEALTH.

Premiums received in 1911	$209,304 31
Premiums received in 1910	145,915 56
Increase	$63,388 75
Losses paid in 1911	$93,473 92
Losses paid in 1910	49,119 96
Increase	$44,353 96

Seven new companies were licensed to transact health insurance during 1911, namely:

American Fidelity Company	Montpelier
American Casualty Company	Tacoma
German Commercial Accident Insurance Company	Philadelphia
Great Eastern Casualty Company	New York
Inter-Ocean Life and Casualty Company	Indianapolis
Premier Indemnity Assurance Company	San Diego
Royal Indemnity Company	New York

ACCIDENT.

Premiums received in 1911	$1,268,899 34
Premiums received in 1910	1,155,040 56
Increase	$113,858 78
Losses paid in 1911	$528,944 12
Losses paid in 1910	415,723 42
Increase	$113,220 70

Seven new companies were licensed to transact accident insurance business during 1911, namely:

American Casualty Company	Tacoma
American Fidelity Company	Montpelier
German Commercial Accident Insurance Company	Philadelphia
Great Eastern Casualty Company	New York
Inter-Ocean Life and Casualty Company	Indianapolis
Premier Indemnity Assurance Company	San Diego
Royal Indemnity Company	New York

LIABILITY.

Premiums received in 1911	$1,268,386 67
Premiums received in 1910	816,361 91
Increase	$452,024 76
Losses paid in 1911	$390,930 32
Losses paid in 1910	276,726 85
Increase	$114,203 47

Three new companies were licensed to transact liability business during the year, namely:

American Fidelity Company	Montpelier
Great Eastern Casualty Company	New York
Royal Indemnity Company	New York

FIDELITY AND SURETY.

Premiums received in 1911	$795,967 03
Premiums received in 1910	691,944 41
Increase	$104,022 62
Losses paid in 1911	$173,388 58
Losses paid in 1910	174,598 02
Decrease	$1,209 44

Four new companies were licensed to transact fidelity and surety business during the year, namely:

American Fidelity Company	Montpelier
Equitable Surety Company	St. Louis
Great Eastern Casualty Company	New York
Royal Indemnity Company	New York

PLATE GLASS.

Premiums received in 1911	$158,278 94
Premiums received in 1910	131,536 06
Increase	$26,742 88
Losses paid in 1911	$42,141 36
Losses paid in 1910	32,289 25
Increase	$9,852 11

Two new companies were licensed to transact plate glass insurance during the year, namely:

Great Eastern Casualty Company	New York
Royal Indemnity Company	New York

BOILER AND MACHINERY.

Premiums received in 1911	$52,931 58
Premiums received in 1910	52,039 99
Increase	$891 59
Losses paid in 1911	$1,206 50
Losses paid in 1910	3,774 25
Decrease	$2,567 75

One new company was licensed to transact boiler and machinery insurance during the year, namely:

Royal Indemnity Company	New York

BURGLARY AND THEFT.

Premiums received in 1911	$103,030 69
Premiums received in 1910	80,989 79
Increase	$22,040 90
Losses paid in 1911	$49,937 08
Losses paid in 1910	26,642 28
Increase	$23,294 80

Three new companies were licensed to transact burglary and theft insurance during the year, namely:

American Fidelity Company	Montpelier
Great Eastern Casualty Company	New York
Royal Indemnity Company	New York

TITLE.

Premiums received in 1911	*$839,750 16
Premiums received in 1910	184,469 44
Increase	$655,280 72
Losses paid in 1911	$2,125 93

Premiums received in 1910	2,427 03
Increase	$963 71
Losses paid in 1911	$124 55
Losses paid in 1910	50 00
Increase	$74 55

One new company was licensed during the year to transact physician's defense, namely:

Medical Protective Company	Fort Wayne

---

*Includes $630,225.29 title guarantee fees which were not included the previous year, which accounts for the great increase.

LIVE STOCK.

Premiums received in 1911	$15,068 57
Premiums received in 1910	20,967 86
Decrease	$5,899 29
Losses paid in 1911	$10,930 00
Losses paid in 1910	13,037 00
Decrease	$2,107 00

TEAM AND VEHICLE.

(Including Automobile Property Damage.)

Premiums received in 1911	$62,136 41
Premiums received in 1910	17,206 95
Increase	$44,929 46
Losses paid in 1911	$21,888 74
Losses paid in 1910	2,713 73
Increase	$19,175 01

The increase is due to the fact that in 1910 only seven companies transacted team and vehicle business, while in 1911 sixteen companies transacted this character of business. The above figures refer to miscellaneous companies; the team and vehicle business transacted by fire and marine companies being reported separately in Table No. 8 of this report.

FRATERNAL BENEFIT SOCIETIES.

Since this department issued its last report the legislature of this State passed a bill, which became a law on June 30, 1911, commonly known as the "Mobile Bill."

Under the provisions of this law the Insurance Commissioner was given supervision and control of fraternal benefit societies transacting insurance business in this State, and such societies have in consequence thereof been required to establish their rights to continue transacting business by filing certain papers and statements showing the number of lodges in this State, their membership and financial condition. The summary and synopsis of these statements, as of December 31, 1911, are herewith shown in this the first report to be issued by this Department since the fraternal law governing these societies in California took effect.

During the year and up to date certificates of authority have been issued to the following societies:

American Nobles	Waterloo, Iowa
Ben Hur (Supreme Tribe)	Crawfordsville, Ind.
Brotherhood of American Yeomen	Des Moines, Iowa
Catholic Knights of America	St. Louis, Mo.
Catholic Order of Foresters	Chicago, Ill.
Church Fraternal	Monmouth, Ill.

Woodmen of the World (Pacific Jurisdiction, Head Camp)	Denver, Colo.
Workmen's Sick and Death Benefit Fund of U. S. A.	New York, N. Y.
Women of Woodcraft	Portland, Ore.

EXAMINATIONS.

The following named societies were examined during the year:

Fraternal Brotherhood	Los Angeles, Cal.
Order of Railway Employees	San Francisco, Cal.
Lincoln Annuity Union (license pending)	San Francisco, Cal.
Americans of California*	Denver, Colo.

MERGERS.

Americans of California----Merged with the Americans, of Springfield, Ill.

Royal Court of Los Angeles----Merged with the Fraternal Brotherhood, of Los Angeles, Cal.

SOCIETIES IN PROCESS OF ORGANIZATION.

United Christian Protective League----------------------Los Angeles, Cal.

---

*Examined by the Insurance Commissioner of Colorado by authorization from this Department.

LEGISLATION OF 1911.

Several important bills and amendments in reference to insurance were passed by the legislature of 1911.

Section 591 of the Political Code was amended so as to provide for an increase in the appropriation for the Insurance Commissioner's Special Fund from $25,000.00 to $30,000.00, out of which all expenses of the Department are paid.

Section 594 of the Political Code, relating to the classification of insurance and the capital stock insurance companies are required to have, was amended so as to provide that any written contract or instrument issued by any person, firm or corporation purporting to show title to real property or furnish information relative thereto, which shall in express terms purport to insure or guarantee such title, shall be deemed a policy of title insurance, and that cyclone, tornado, windstorm and lightning insurance be classed as miscellaneous insurance, and provides that a fire insurance company may be licensed to transact said miscellaneous insurance, providing that no company shall do any of said kinds of insurance unless authorized so to do by its charter.

Section 596 of the Political Code, relating to the transaction of surplus line insurance, was amended reducing the license fee required to be paid by a surplus line broker from fifty dollars to twenty-five dollars, the bond required to be filed from twenty thousand to five thousand, the premium tax from four per cent to three per cent, and further provides for the filing of a list of authorized companies, comprising a majority thereof, from whom the insurance effected was not obtainable in the case of each risk written.

Section 597 of the Political Code was amended so as to provide that no certificate of authority shall be issued to any insurance company or corporation hereafter organized or incorporated in this State, whether the same be organized and promoted directly or by means of a holding company or corporation, one of the purposes of which is the organization and promotion of such insurance company or corporation, where the examination shows the expenses of organization and promotion to be in excess of fifteen per cent of the total amount actually paid on its capital stock, exclusive of surplus, and also provides that a company, organized and existing under the laws of any country outside of the United States, shall be deemed to be organized within the meaning of this act in any State wherein such company maintains the deposits required by the law of this State.

Section 607 of the Political Code, providing for charter and similar papers to be filed before a company can engage in business in this

State, was amended so as to provide for the filing of a verified financial statement exhibiting the condition and affairs of such company, and also required a complete list of all officers and persons by whom the business is or may be managed.

Section 611 of the Political Code, relating to the filing, adjusting and publishing of annual statements, was amended to provide that companies may publish either for the period of one week in some daily newspaper of general circulation or four consecutive times in some weekly newspaper of general circulation.

Section 450 of the Civil Code, relating to the provisions to be contained in life insurance policies, was amended.

STATUTES ENACTED.

An act for the regulation and control of fraternal benefit societies, approved May 1, 1911.

An act defining certain classes of contracts for the exchange of indemnity, prescribing regulations therefor, and fixing a license fee, approved May 1, 1911.

An act relating to the liability of employers for injuries or death sustained by their employees, providing for compensation for the accidental injury of their employees, establishing an industrial board, making an appropriation therefor, defining its powers, and providing a review of its awards.

An act to carry into effect the provisions of section 14 of article 13 of the constitution of the State of California, as said constitution was amended November 10, 1910, providing for the separation of state from local taxation, and providing for the taxation of public service and other corporations, banks, and insurance companies for the benefit of the State, all relating to revenue and taxation.

AMENDMENTS.

An act to provide for the organization and management of county fire insurance companies was amended, to provide that no company shall issue policies on property situate within the corporate limits of any city or town in excess of four thousand five hundred dollars on any one risk under one or more policies. No adjoining risks can be taken by such company unless a clear space of at least one hundred and fifty feet intervenes, and such intervening space must continue at not less than one hundred feet during the life of the policy. Nor shall any risk be taken on any building closer than one hundred feet to any business property, provided the amount of the insurance shall not exceed seventy-five per cent of the value of the property, and no additional insurance shall be allowed.

DEPARTMENT COLLECTIONS AND EXPENDITURES.

Under the provisions of section 14 of article 13 of the constitution of the State of California, as said constitution was amended November 8, 1910, taxes are no longer collected from insurance companies by this Department. The amount of business transacted by each company is reported by this Department to the State Board of Equalization, who in turn assess and levy the taxes, which are payable to the State Treasurer direct.

The total amount of fees collected by this Department during the year 1911 was		$53,708 80
EXPENDITURES.
